McNeil,2013-06-29 The development and evaluation of Parent Child Interaction Therapy PCIT has been a very rewarding aspect of my academic career and I am excited to see the program detailed in this excellent clinical guide PCIT is a short term intervention with documented effectiveness that has much to offer mental health professionals who work with young behaviorally disordered children After approximately 12 therapy hours improvements can be seen in parenting stress levels parent child interactional patterns parenting skills child disruptiveness and child compliance Yet prior to the publication of this practitioner guide book relatively few child therapists have had exposure to this innovative treatment approach The development of PCIT began in the early 1970s I had recently completed a doctoral program focusing on behavioral parent training procedures and a postdoctoral experience emphasizing traditional play therapy approaches with children Despite the

wide theoretical gap between these two orientations I recognized that each had valuable therapeutic elements that could contribute to an overall treatment package It became an exciting challenge to integrate traditional and behavioral concerns I was particularly interested in developing a child behavior modification program with strong relationship based components The work of my colleague Constance Hanf had a direct influence on the development of PCIT Hanf outlined a two stage operant model for modifying the noncompliant behavior of young children The first stage emphasized following the child's lead and using differential attention during play sessions
