G Protein-Coupled Receptors Jesus Giraldo, Jean-Philippe Pin, 2011-08-16 G protein coupled receptors GPCRs are the largest family of cell surface receptors with more than 800 members identified thus far in the human genome They regulate the function of most cells in the body and represent approximately 3% of the genes in the human genome These receptors respond to a wide variety of structurally diverse ligands ranging from small molecules such as biogenic amines nucleotides and ions to lipids peptides proteins and even light Ligands agonists and antagonists acting on GPCRs are important in the treatment of numerous diseases including cardiovascular and mental disorders retinal degeneration cancer and AIDS It is estimated that these receptors represent about one third of the actual identified targets of clinically used drugs The determination of rhodopsin crystal structure and more recently of opsin 1 and 2 adrenergic and A2A adenosine receptors provides both academia and industry with extremely valuable data for a better understanding of the molecular determinants of receptor function and a more reliable rationale for drug design GPCR structure and function constitutes a hot topic The book which lies between the fields of chemical biology molecular pharmacology and medicinal chemistry is divided into three parts The first part considers what receptor structures tell us about the mechanism of receptor activation Part II focuses on receptor function It discusses what the data from biophysical and mutational studies and the analysis of the interactions of the receptor with ligands and regulator proteins tell us about the process of signal transduction The final part on modelling and simulation details new insights on the link between structure and mechanism and their implications in drug design

G Protein-Coupled Receptors - Modeling and Simulation Marta Filizola, 2013-10-25 G protein coupled receptors GPCRs are heptahelical transmembrane receptors that convert extra cellular stimuli into intra cellular signaling and ultimately into biological responses Since GPCRs are natural targets for approximately 40% of all modern medicines it is not surprising that they have been the subject of intense research Notwithstanding the amount of data generated over the years discovering ligands of these receptors with optimal therapeutic properties is not straightforward and has certainly been hampered for years by the lack of high resolution structural information about these receptors Luckily there has been a steady increase of high resolution crystal structures of these receptors since 2007 and this information integrated with dynamic inferences from computational and experimental methods holds great potential for the discovery of new improved drugs This book which provides for the first time state of the art views on modeling and simulation of GPCRs is divided into 4 parts In the first part the impact of currently available GPCR crystal structures on

structural modeling is discussed extensively as are critical insights from simulations in the second part of the book The third part reports recent progress in rational ligand discovery and mathematical modeling whereas the fourth part provides an overview of bioinformatics tools and resources that are available for GPCRs
