Feedforward and Feedback Processes in Vision Hulusi Kafaligonul, Bruno G. Breitmeyer, Haluk Öğmen, 2015-07-10 The visual system consists of hierarchically organized distinct anatomical areas functionally specialized for processing different aspects of a visual object Felleman Van Essen 1991 These visual areas are interconnected through ascending feedforward projections descending feedback projections and projections from neural structures at the same hierarchical level Lamme et al 1998 Accumulating evidence from anatomical functional and theoretical studies suggests that these three projections play fundamentally different roles in perception However their distinct functional roles in visual processing are still subject to debate Lamme Roelfsema 2000 The focus of this Research Topic is the roles of feedforward and feedback projections in vision Even though the notions of feedforward feedback and reentrant processing are widely accepted it has been found

difficult to distinguish their individual roles on the basis of a single criterion We welcome empirical contributions theoretical contributions and reviews that fit into any one or a combination of the following domains 1 their functional roles for perception of specific features of a visual object 2 their contributions to the distinct modes of visual processing e g pre attentive vs attentive conscious vs unconscious 3 recent techniques methodologies to identify distinct functional roles of feedforward and feedback projections and corresponding neural signatures We believe that the current Research Topic will not only provide recent information about feedforward feedback processes in vision but also contribute to the understanding fundamental principles of cortical processing in general

Representation and Recognition in Vision Shimon Edelman,1999 Shimon Edelman bases a comprehensive approach to visual representation on the notion of correspondence between proximal internal and distal similarities in objects Researchers have long sought to understand what the brain does when we see an object what two people have in common when they see the same object and what a seeing machine would need to have in common with a human visual system Recent neurobiological and computational advances in the study of vision have now brought us close to answering these and other questions about representation In Representation and Recognition in Vision Shimon Edelman bases a comprehensive approach to visual representation on the notion of correspondence between proximal internal and distal similarities in objects This leads to a computationally feasible and formally veridical representation of distal objects that addresses the needs of shape categorization and can be used to derive models of perceived similarity Edelman first discusses the representational needs of various visual recognition tasks and surveys current theories of representation in this context He then develops a theory of representation that is related to Shepard s notion of second order isomorphism between representations and their targets Edelman goes beyond Shepard by specifying the conditions under which the representations can be made formally veridical Edelman assesses his theory s performance in identification and categorization of 3D shapes and examines it in light of psychological and neurobiological data concerning the object processing stream in primate vision He also discusses the connections between his theory and other efforts to understand representation in the brain

Machine Vision Fabio Solari,Manuela Chessa,Silvio P. Sabatini,2012-03-23 Vision plays a fundamental role for living beings by allowing them to interact with the environment in an effective and efficient way The ultimate goal of Machine Vision is to endow artificial systems with adequate capabilities to cope with not a priori predetermined situations To this end we have to take into account the computing constraints of the hosting architectures and the specifications of the tasks to be accomplished to continuously adapt and optimize the visual processing techniques Nevertheless by exploiting the low cost computational power of off the shell computing devices Machine Vision is not limited any more to industrial environments where situations and tasks are simplified and very specific but it is now pervasive to support system solutions of everyday life problems

Applications of

Parallel Processing in Vision J.R. Brannan,1992-01-23 Considerable evidence exists that visual sensory information is analyzed simultaneously along two or more independent pathways In the past two decades researchers have extensively used the concept of parallel visual channels as a framework to direct their explorations of human vision More recently basic and clinical scientists have found such a dichotomy applicable to the way we organize our knowledge of visual development higher order perception and visual disorders to name just a few This volume attempts to provide a forum for gathering these different perspectives
