Image Structure Luc Florack, 2013-04-17 Despite the fact that images constitute the main objects in computer vision and image analysis there is remarkably little concern about their actual definition In this book a complete account of image structure is proposed in terms of rigorously defined machine concepts using basic tools from algebra analysis and differential geometry Machine technicalities such as discretisation and quantisation details are de emphasised and robustness with respect to noise is manifest From the foreword by Jan Koenderink It is my hope that the book will find a wide audience including physicists who still are largely unaware of the general importance and power of scale space theory mathematicians who will find in it a principled and formally tight exposition of a topic awaiting further development and computer scientists who will find here a unified and conceptually well founded framework for many apparently unrelated and largely historically motivated methods they already know and love The book is suited for self study and graduate courses the carefully formulated exercises are designed to get to grips with the subject matter and prepare the reader for original research

The Perception of Visual Information William Thomson,Peter N.T. Wells,2013-03-09 Human knowledge is primarily the product of experiences acquired through interactions of our senses with our surroundings Of all the senses vision is the one relied on most heavily by most people for sensory input about the environment Visual interactions can be divided into three processes 1 detection of visual information 2 recognition of the external source of the information and 3 interpretation of the significance of the information These processes usually occur sequentially although there is considerable interdependence among them With our strong dependence on the processes of visual interactions we might assume that they are well characterized and understood Nothing could be further from the truth Human vision remains an enigma in spite of speculations by philosophers for centuries and more recently of attention from physicists and cognitive and experimental psychologists How we see and how we know what we see remains an unsolved mystery that challenges some of the most creative scientists and cognitive specialists
