Image Representation and Processing V.V. Alexandrov, Gorsky, 2012-12-06 Recently much attention has been paid to image processing with multiresolution and hierarchical structures such as pyramids and trees This volume deals with recursive pyramids which combine the advantages of available multiresolution structures and which are convenient both for global and local image processing Recursive pyramids are based on regular hierarchical recursive structures containing data on image fragments of different sizes Such an image representation technique enables the effective manipulation of pictorial information as well as the development of special hardware or data structures The major aspects of this book are two original mathematical models of greyscale and binary images represented by recursive structures Image compression transmission and processing are discussed using these models A number of applications are presented including optical character recognition expert systems and special computer architecture for pictorial data processing The majority of results are presented as algorithms applicable to discrete information fields of arbitrary dimensions e g 2 D or 3 D images The book is divided into six chapters Chapter 1 provides a brief introduction Chapter 2 then deals with recursive structures and their properties Chapter 3 introduces pyramidal image models Image coding and the progressive transmission of images with gradual refinement are discussed in Chapter 4 Chapters 5 and 6 are devoted to image processing with pyramidal recursive structures and applications The volume concludes with a comprehensive bibliography For applied mathematicians and computer scientists whose work involves computer vision information theory and other aspects of image representation techniques

DIGITAL IMAGE REPRESENTATION AND IMAGE SEGMENTATION Mr. Sumit R. Vaidya, Mrs. Swati Vaidya, Ms. Kriti Joshi, Dr. Hemlata Patel, 2023-03-16 The human eye has the capability of seeing individual rays of light but it is the human brain that has the capability of perceiving individuals automobiles buildings and everything else that constitutes the world A camera may be able to pick up on separate beams of light but a computer has the ability to differentiate between each individual color dot The frustrating disparity that exists between the visual perceptions of humans and computers has been a source of ongoing annoyance for those who work in the field of computer vision for a significant amount of time Those who work in this field have been forced to deal with this issue for a significant amount of time How is it that something as simple as a collection of dots of varying colors can become something as complex as a steaming mug of coffee How are we going to teach computers to identify and organize all of the many sorts of things that they come across It is immediately obvious that a single colored dot transmits relatively little information about the broader entity to which it belongs when one gives this subject any consideration at all This understanding comes to one very immediately after beginning to reflect on the topic in question It is not possible to identify a cheetah based solely on a single black dot rather a larger section of the visual field is required in order to recognize the distinct recurrent patches of black on golden fur that are characteristic of this species If you have a larger visual field you will be able to recognize a cheetah This results in the difficult problem of

choosing which feature of a picture has to be focused on in order to guarantee that an item can be recognized correctly The answer to this question is obviously the pixels that make up the item it should go without saying that this is the case Unhappily things may take on a confusing number of forms and even a single item like our cheetah can significantly alter the way it looks from different viewpoints This is one of the things that makes the world a fascinating and unpredictable place This is only one example of the numerous terrible things that happen in the real world Signal and Image Representation in Combined Spaces Yehoshua Zeevi, Ronald Coifman, 1998-02-09 This volume explains how the recent advances in wavelet analysis provide new means for multiresolution analysis and describes its wide array of powerful tools The book covers variations of the windowed Fourier transform constructions of special waveforms suitable for specific tasks the use of redundant representations in reconstruction and enhancement applications of efficient numerical compression as a tool for fast numerical analysis and approximation properties of various waveforms in different contexts Image Understanding using Sparse Representations Jayaraman J. Thiagarajan, Karthikeyan Natesan Ramamurthy, Pavan Turaga, Andreas Spanias, 2022-06-01 Image understanding has been playing an increasingly crucial role in several inverse problems and computer vision Sparse models form an important component in image understanding since they emulate the activity of neural receptors in the primary visual cortex of the human brain Sparse methods have been utilized in several learning problems because of their ability to provide parsimonious interpretable and efficient models Exploiting the sparsity of natural signals has led to advances in several application areas including image compression denoising inpainting compressed sensing blind source separation super resolution and classification The primary goal of this book is to present the theory and algorithmic considerations in using sparse models for image understanding and computer vision applications To this end algorithms for obtaining sparse representations and their performance guarantees are discussed in the initial chapters Furthermore approaches for designing overcomplete data adapted dictionaries to model natural images are described The development of theory behind dictionary learning involves exploring its connection to unsupervised clustering and analyzing its generalization characteristics using principles from statistical learning theory An exciting application area that has benefited extensively from the theory of sparse representations is compressed sensing of image and video data Theory and algorithms pertinent to measurement design recovery and model based compressed sensing are presented The paradigm of sparse models when suitably integrated with powerful machine learning frameworks can lead to advances in computer vision applications such as object recognition clustering segmentation and activity recognition Frameworks that enhance the performance of sparse models in such applications by imposing constraints based on the prior discriminatory information and the underlying geometrical structure and kernelizing the sparse coding and dictionary learning methods are presented In addition to presenting theoretical fundamentals in sparse learning this book provides a platform for interested readers to explore the vastly growing application domains of sparse representations *The Image and the Eye* E.H.

Multimodal Interaction in Image and Video Applications Angel D. Sappa,Jordi Vitrià,2013-01-11 Traditional Pattern Recognition PR and Computer Vision CV technologies have mainly focused on full automation even though full automation often proves elusive or unnatural in many applications where the technology is expected to assist rather than replace the human agents However not all the problems can be automatically solved being the human interaction the only way to tackle those applications Recently multimodal human interaction has become an important field of increasing interest in the research community Advanced man machine interfaces with high cognitive capabilities are a hot research topic that aims at solving challenging problems in image and video applications Actually the idea of computer interactive systems was already proposed on the early stages of computer science Nowadays the ubiquity of image sensors

together with the ever increasing computing performance has open new and challenging opportunities for research in multimodal human interaction This book aims to show how existing PR and CV technologies can naturally evolve using this new paradigm The chapters of this book show different successful case studies of multimodal interactive technologies for both image and video applications They cover a wide spectrum of applications ranging from interactive handwriting transcriptions to human robot interactions in real environments
