Electronics System Design Techniques for Safety Critical Applications Luca

Sterpone, 2008-10-10 What is exactly Safety A safety system should be defined as a system that will not endanger human life or the environment A safety critical system requires utmost care in their specification and design in order to avoid possible errors in their implementation that should result in unexpected system s behavior during his operating life An inappropriate method could lead to loss of life and will almost certainly result in financial penalties in the long run whether because of loss

of business or because the imposition of fines Risks of this kind are usually managed with the methods and tools of the safety engineering A life critical system is designed to lose less than one life per billion 10 Nowadays computers are used at least an order of magnitude more in safety critical applications compared to two decades ago Increasingly electronic devices are being used in applications where their correct operation is vital to ensure the safety of the human life and the environment These applications ranging from the anti lock braking systems ABS in automobiles to the fly by wire aircrafts to biomedical supports to the human care Therefore it is vital that electronic designers be aware of the safety implications of the systems they develop State of the art electronic systems are increasingly adopting programmable devices for electronic applications on earthling system In particular the Field Programmable Gate Array FPGA devices are becoming very interesting due to their characteristics in terms of performance dimensions and cost
