Yuhas, 2005-10-03 A benchmark text on software development and quantitative software engineering We all trust software All too frequently this trust is misplaced Larry Bernstein has created and applied quantitative techniques to develop trustworthy software systems He and C M Yuhas have organized this quantitative experience into a book of great value to make software trustworthy for all of us Barry Boehm Trustworthy Systems Through Quantitative Software Engineering proposes a novel reliability driven software engineering approach and discusses human factors in software engineering and how these affect team dynamics This practical approach gives software engineering students and professionals a solid foundation in problem analysis allowing them to meet customers changing needs by tailoring their projects to meet specific challenges and complete projects on schedule and within budget Specifically it helps developers identify customer requirements develop software designs manage a software development team and evaluate software products to customer specifications Students learn magic numbers of software engineering rules of thumb that show how to simplify architecture design and implementation Case histories and exercises clearly present successful software engineers experiences and illustrate potential problems results and trade offs Also featuring an accompanying Web site with additional and related material Trustworthy Systems Through Quantitative Software Engineering is a hands on project oriented resource for upper level software and computer science students engineers professional developers managers and professionals involved in software engineering projects An Instructor s Manual presenting detailed solutions to all the problems in the book is available from the Wiley editorial department An Instructor Support FTP site is also available **Textbank Systems** Erhard Mergenthaler, 2013-06-29 Psychoanalysis and information science are two disciplines that twenty years ago hardly anyone would have considered closely related with regard either to persons or subject matter The cooperation between the two fields was made possible on the one hand by the development of information science from a technological discipline to a theoretically founded scientific discipline and on the other by the development of psychoanalysis from a hermetically closed special discipline to an open and empirical science This study reports the successful inclusion of information science as an instrument of research on the psychoanalytic process This direction of work was initiated by Donald Spence and Hartvig Dahl from the Research Institute of Mental Health New York at the end of the 1960s H Thom H K che1e and their research group in Ulm must be credited with having adopted Spence s programs as early as 1974 at that time the programs even had to be implemented far away on the IBM computer at the University of Heidelberg The efforts to expand computer aided content analysis to a method for process research led in 1975 to the acquisition of the Hamburg program for Electronic Verbal Analysis EVA In the following years the author of this study revised extended and supplemented the EVA to create the U1m version This book now describes another step in the

integration of information technology in fundamental research in psychoanalysis
