Hunt,Martin Koltzenburg,2005 The last decade has seen major advances in the neurobiology of pain primarily resulting from a deeper understanding of the way in which pain signals are coded and processed in the nervous system This volume in the Molecular and Cellular Neurobiology is the first book for many years to present an integrated overview of the current state of research into the neurobiology of chronic and acute pain While recent molecular aspects of nociception are covered in some detail the book also emphasises the importance of viewing the pain experience as the co ordinated response of many different areas of the nervous system The molecular advances are set in the context of the neurobiological system of pain processing The appropriate behavioural response to injury can therefore be thought of as the result of the integration of information processed within areas of the brain concerned with cognition affect sensory discrimination and movement Chapters cover recent advances in nociceptor transduction mechanisms nociceptor plasticity and the biochemical anatomy of pain pathways Other contributions are concerned with the development of pain systems and with the central processing of nociceptive information studied with brain imaging techniques Several chapters additionally cover the mechanisms of clinically important pain states such as neuropathic pain cancer related pain and migraine A new volume in the Molecular and Cellular Neurobiology series this volume presents a state of the art account of the neurobiological basis of pain edited and written by the leading scientists in this field **The Human Pain System** Frederick A. Lenz,Kenneth L. Casey,Edward G. Jones,William D. Willis,2010-01-21 Pain is a subject of significant scientific and clinical interest This has resulted both from realistic rodent models and the publication of imaging psychological and pharmacological studies in humans Investigators studying rodents refer to anatomical and physiological studies in non human primates to make their results relevant to humans Psychophysical and pharmacological studies in humans are interpreted in terms of anatomical and physiological studies in animals primarily evidence from rodents and cats There are significant differences in pain mechanisms between these species and primates Over 20 years of imaging studies

have demonstrated the activation of human cortical and subcortical structures in response to painful stimuli Interpretation of these results relies upon an understanding of the anatomy and physiology of these structures in primates Jones Lenz Casey and Willis review the anatomy and physiology of nociception in monkeys and humans and provide a firm basis for interpreting studies in humans
