3D-Position Tracking and Control for All-Terrain Robots Pierre Lamon, 2008-02-12 Rough terrain robotics is a fast evolving field of research and a lot of effort is deployed towards enabling a greater level of autonomy for outdoor vehicles This book demonstrates how the accuracy of 3D position tracking can be improved by considering rover locomotion in rough terrain as a holistic problem Although the

selection of appropriate sensors is crucial to accurately track the rover's position it is not the only aspect to consider. Indeed the use of an unadapted locomotion concept severely affects the signal to noise ratio of the sensors which leads to poor motion estimates. In this work a mechanical structure allowing smooth motion across obstacles with limited wheel slip is used. In particular it enables the use of odometry and inertial sensors to improve the position estimation in rough terrain. A method for computing 3D motion increments based on the wheel encoders and chassis state sensors is developed. Because it accounts for the kinematics of the rover this method provides better results than the standard approach. To further improve the accuracy of the position tracking and the rover's climbing performance a controller minimizing wheel slip is developed. The algorithm runs online and can be adapted to any kind of passive wheeled rover. Finally sensor fusion using 3D Odometry inertial sensors and visual motion estimation based on stereovision is presented. The experimental results demonstrate how each sensor contributes to increase the accuracy and robustness of the 3D position estimation.

Geotechnical Aspects of Underground Construction in Soft Ground Klaas Jan Bakker, Adam Bezuijen, Wout Broere, E.A. Kwast, 2013-05-23 A valuable source of reference on the current practices of analysis design and construction of tunnels and underground structures in soft ground. This collection of reviewed papers covers a wide range of tunnelling practice from deep excavations in Singapore to the construction of a new metro line in Barcelona. The international scope of the contributors makes this a truly comprehensive collection of work on the geotechnical aspects of soft ground excavation.

Automatic Reconstruction of Textured 3D Models Pitzer, Benjamin, 2015-03-23 Three dimensional modeling and visualization of environments is an increasingly important problem. This work addresses the problem of automatic 3D reconstruction and we present a system for unsupervised reconstruction of textured 3D models in the context of modeling indoor environments. We present solutions to all aspects of the modeling process and an integrated system for the automatic creation of large scale 3D models.

Engineering Design Graphics Journal, 2003 **NASA Tech Briefs**, 2002 **3D Robotic Mapping** Andreas Nüchter, 2008-12-18 Focuses on acquiring spatial models of physical environments through mobile robots. The robotic mapping problem is commonly referred to as SLAM: simultaneous localization and mapping. 3D maps are necessary to avoid collisions with complex obstacles and to self-localize in six degrees of freedom: x, y, z position, roll, yaw and pitch angle. New solutions to the 6D SLAM problem for 3D laser scans are proposed and a wide variety of applications are presented.
