The Feature-Driven Method for Structural Optimization Weihong Zhang, Ying Zhou, 2020-11-05 The Feature Driven Method for Structural Optimization details a novel structural optimization method within a CAD framework integrating structural optimization and feature based design The book presents cutting edge research on advanced structures and introduces the feature driven structural optimization method by regarding engineering features as basic design primitives Consequently it presents a method that allows structural optimization and feature design to be done simultaneously so that feature attributes are preserved throughout the design process The book illustrates and supports the effectiveness of the method described showing potential applications through numerical modeling techniques and programming This volume presents a high performance optimization method adapted to engineering structures a novel perspective that will help engineers in the computation modeling and design of advanced structures Integrates two independent methods structural optimization and feature based design into one framework Adapts the high performance optimization method to the practice of designing engineering structures Provides numerical evidence for the effectiveness and potential of the methods described Works within a computer aided design framework to develop a novel structural optimization methodology Presents engineering features as the basic design primitives in structural optimization

*Meshless Methods in Biomechanics* Jorge Belinha, 2014-05-14 This book presents the complete formulation of a new advanced discretization meshless technique the Natural Neighbour Radial Point Interpolation Method NNRPIM In addition two of the most popular meshless methods the EFGM and the RPIM are fully presented Being a truly meshless method the major advantages of the NNRPIM over the FEM and other meshless methods are the remeshing flexibility and the higher accuracy of the obtained variable field Using the natural neighbour concept the NNRPIM permits to determine organically the influence domain resembling the cellulae natural behaviour This innovation permits the analysis of convex boundaries and extremely irregular meshes which is an advantage in the biomechanical analysis with no extra computational effort associated This volume shows how to extend the NNRPIM to the bone tissue remodelling analysis expecting to contribute with new numerical tools and strategies in order to permit a more efficient numerical biomechanical analysis

First, it addresses the status of Human Rights Conventions and the challenges resulting from human rights standards for Chinese criminal procedural law and practice. The discussion then moves on to explore the fundamentals of Chinese criminal procedure, such as the applicable law found in the Chinese CPL, Criminal Procedure Law, and legal institutions. The book covers relevant actors in the Chinese Criminal Justice System, i.e., judges, prosecutors, police, defence councils, as well as the relationships between them. It also includes topics relating to the victims of crime and their role in criminal proceedings. Starting with pre-trial investigations, extending in particular to coercive measures and discretionary powers in the implementation of non-prosecution policies, the book continues as a guide through the basic principles of criminal trial, standards of evidence, and rules related to conviction. Appeals and the issue of reopening criminal proceedings are also considered, with the book making particular reference to a number of special procedures, including juvenile delinquency, in the closing chapter.
