Free and Moving Boundary Problems John Crank, 1984      **Moving Boundaries VI** B. Šarler, C. A. Brebbia, 2001 Sixth International Conference on the Computational Modelling of Free and Moving Boundary Problems P facing t p      Moving Boundaries IV R. van Keer, C. A. Brebbia, 1997 Contains the proceedings of the Fourth International Conference on Computational Modelling of Free and Moving Boundary Problems held during August 1997 The purpose of this text is to promote the interaction between engineers applied mathematicians and numerical analysts involved in the creation development and application of computational methods to free and moving boundary problems      *Computational Modelling of Free and Moving Boundary Problems ; 1*, 1991      **Moving Boundaries VII** A. A. Mammoli, C. A. Brebbia, 2004 In these proceedings from the November 2003 conference contributors consider the computational modeling of a continuum where the positions of its borders or interphase boundaries must also be found They examine theory models methods and applications in different research perspectives Topics include boundary tracking fluid structure interactions flow through porous media free surface flow phase change phase interface phenomena and advanced computational methods in two and three dimensions Applications include microelectronics medicine and materials science The U S office of WIT Press is Computational Mechanics Annotation 2004 Book News Inc Portland OR booknews com      **Free and Moving Boundary Problems in Hydrodynamics** S. **Design and Analysis of Numerical Methods for Free- and Moving-boundary Problems** Evan Scott Gawlik, 2015 This thesis presents the design and analysis of numerical methods for free and moving boundary problems partial differential equations posed on domains that change with time Two principal developments are presented First a novel framework is introduced for solving free and moving boundary problems with a high order of accuracy This framework has the distinct advantage that it can handle large domain deformations easily a common difficulty faced by conventional deforming mesh methods while representing the geometry of the moving domain exactly an infeasible task for conventional fixed mesh methods This is accomplished using a universal mesh a background mesh that contains the moving domain and conforms to its geometry at all times by perturbing a small number of nodes in a neighborhood of the moving boundary The resulting

framework admits in a general fashion the construction of methods that are of arbitrarily high order of accuracy in space and time when the boundary evolution is prescribed Numerical examples involving phase change problems fluid flow around moving obstacles and free surface flows are presented to illustrate the technique Second a unified analytical framework is developed for establishing the convergence properties of a wide class of numerical methods for moving boundary problems This class includes as special cases the technique described above as well as conventional deforming mesh methods commonly known as arbitrary Lagrangian Eulerian or ALE schemes An instrumental tool developed in this analysis is an abstract estimate which applies to rather general mesh motions for the error incurred by finite element discretizations of parabolic moving boundary problems Specializing the abstract estimate to particular choices of the mesh motion strategy and finite element space leads to error estimates in terms of the mesh spacing for various semidiscrete schemes We illustrate this by deriving error estimates for ALE schemes under mild assumptions on the nature of the mesh deformation and the regularity of the exact solution and the moving domain and we do the same for universal meshes      *Free and Moving Boundary Problems in Ion Beam Dynamics* Peter Spence, 2012
