Intelligent Spatial Decision Support Systems Yee Leung, 2012-12-06 In the past half century we have experienced two major waves of methodological development in the study of human behavior in space and time The first wave was the well known quantitative revolution which propelled geography from a mainly descriptive discipline to a scientific discipline using formalism such as probability statistics and a large number of mathematical methods for analyzing spatial structures and processes under certainty and uncertainty The second wave is the recent advancement of geographical information systems which equips geographers with automation in the storage retrieval analysis and display of data Both developments have significant impacts on geographical studies in general and solutions to real life spatio temporal problems in particular They have found applications in urban and regional planning automated mapping and facilities management transportation planning and management as well as environmental planning and management to name but a few examples Both developments have one thing in common They one way or the other use computer to process and analyze data However not until recently there has been very little interaction between the two Quantitative models have largely been developed independent of the underlying data models and structures representing the spatial phenomena or processes under study Display of analysis results has been primitive in terms of the utilization of computer graphic technologies Formal models in addition to their technical difficulties have poor capability in communication with users Geographical information systems on the other hand have originally been developed with a slight intention to entertain powerful analytical models

Tenreiro Machado,Béla Pátkai,Imre J. Rudas,2008-12-18 Engineering practice often has to deal with complex systems of multiple variable and multiple parameter models almost always with strong non linear coupling The conventional analytical techniques based approaches for describing and predicting the behaviour of such systems in many cases are doomed to failure from the outset even in the phase of the construction of a more or less appropriate mathematical model These approaches normally are too categorical in the sense that in the name of modelling accuracy they try to describe all the structural details of the real physical system to be modelled This can significantly increase the intricacy of the model and may result in a enormous computational burden without achieving considerable improvement of the solution The best paradigm exemplifying this situation may be the classic perturbation theory the less significant the achievable correction the more work has to be invested to obtain it A further important component of machine intelligence is a kind of structural uniformity giving room and possibility to model arbitrary particular details a priori not specified and unknown This idea is similar to the ready to wear industry which introduced

products which can be slightly modified later on in contrast to tailor made creations aiming at maximum accuracy from the beginning These subsequent corrections can be carried out by machines automatically This learning ability is a key element of machine intelligence The past decade confirmed that the view of typical components of the present soft computing as fuzzy logic neural computing evolutionary computation and probabilistic reasoning are of complementary nature and that the best results can be applied by their combined application Today the two complementary branches of Machine Intelligence that is Artificial Intelligence and Computational Intelligence serve as the basis of Intelligent Engineering Systems The huge number of scientific results published in Journal and conference proceedings worldwide substantiates this statement The present book contains several articles taking different viewpoints in the field of intelligent systems

Theory and Practice of Uncertain Programming Baoding Liu, 2009-03-17 This book provides comprehensive coverage of uncertain programming theory including numerous modeling ideas hybrid intelligent algorithms and applications in system reliability design vehicle routing problem and machine scheduling problem

Uncertainty Theory Baoding Liu, 2007-09-14 It was generally believed that the study of probability theory was started by Pascal and Fermat in 1654 when they succeeded in deriving the exact probabilities for certain gambling problem Great progress was achieved when Von Mises initialized the concept of sample space and closed the gap between probability theory and measure theory in 1931 An axiomatic foundation of

probability theory was given by Kolmogorov in his *Foundations of Probability Theory* of 1933 Since then probability theory has been developed steadily and has been widely applied in science and engineering Probability theory will be introduced in Chapter 2 Fuzzy set was initiated by Zadeh via membership function in 1965 and was well developed and applied in a wide variety of

real problems In order to measure a fuzzy event Zadeh proposed the concept of possibility measure in 1978 Although possibility measure has been widely used it has no self duality property However a self dual measure is absolutely needed in both theory and practice In order to define a self dual measure Liu and Liu gave the concept of credibility measure in 2002 Credibility theory is a branch of mathematics that studies the behavior of fuzzy phenomena An axiomatic foundation of credibility theory was given by Liu in his Uncertainty Theory of 2004 Chapter 3 will provide the credibility theory Sometimes fuzziness and randomness simultaneously appear in a system

Methods and Applications of Intelligent Control S.G. Tzafestas, 2012-12-06 This book is concerned with Intelligent Control methods and applications The field of intelligent control has been expanded very much during the recent years and a solid body of theoretical and practical results are now available These results have been obtained through the synergetic fusion of concepts and techniques from a variety of fields such as automatic control systems science computer science neurophysiology and operational research Intelligent control systems have to perform anthropomorphic tasks fully autonomously or interactively with the human under known or unknown and uncertain environmental conditions Therefore the basic components of any intelligent control system include cognition perception learning sensing planning numeric and symbolic processing fault detection repair reaction and control action These components must be linked in a systematic synergetic and efficient way Predecessors of intelligent control are adaptive control self organizing control and learning control which are well documented in the literature Typical application examples of intelligent controls are intelligent robotic systems intelligent manufacturing systems intelligent medical systems and intelligent space teleoperators Intelligent controllers must employ both quantitative and qualitative information and must be able to cope with severe temporal and spatial variations in addition to the fundamental task of achieving the desired transient and steady state performance Of course the level of intelligence required in each particular application is a matter of discussion between the designers and users The current literature on intelligent control is increasing but the information is still available in a sparse and disorganized way
