Interferon Alpha2 Preclinical And Clinical Evaluation:

Interferon Alpha-2: Pre-Clinical and Clinical Evaluation Daniel L. Kisner, J.F. Smyth, 2012-12-06 Interferon alpha 2 is a genetically engineered highly purified pharmaceutical agent that has undergone extensive phase I and phase II clinical study in more than 1000 patients. The material has biological activity by intravenous, intramuscular and subcutaneous routes. Clinical toxicity principally involves the influenza like syndrome previously seen with native interferons. Other important toxicities include anorexia, hepatitis, confusion and myelosuppression. Tolerable doses in multiple schedules and routes of administration have been determined. Phase II clinical trials with multiple routes and schedules of administration have been performed. Significant clinical activity has been found in non-Hodgkin's lymphomas, both low grade and high grade, refractory and relapsing multiple myeloma, hairy cell leukemia, Kaposi's sarcoma, with suggestions of activity in Hodgkin's disease, renal cell carcinoma and melanoma. The studies performed to date have for the most part involved small numbers of heavily pretreated patients. Large scale clinical trials in some of these diseases are now warranted in populations of patients with as little bulk disease and prior treatment as is feasible for each tumour type. This is particularly the case in Hodgkin's disease and subcategories of the non-Hodgkin's lymphomas. Alternatively, interferon alpha 2 might be used to maintain remissions induced by other modalities, i.e. in NHL, multiple myeloma, ovarian cancer. In some advanced disease settings, combinations of interferon alpha 2 with chemotherapeutic agents should now be investigated.

Concepts, Clinical Developments, and Therapeutic Advances in Cancer Chemotherapy Franco M. Muggia, 2012-12-06 Where do you begin to look for a recent authoritative article on the diagnosis or management of a particular malignancy? The few general oncology textbooks are generally out of date. Single papers in specialized journals are informative but seldom comprehensive; these are more often preliminary reports on a very limited number of patients. Certain general journals frequently publish good in-depth reviews of cancer topics and published symposium lectures are often the best overviews available. Unfortunately, these reviews and supplements appear sporadically and the reader can never be sure when a topic of special interest will be covered. *Cancer Treatment and Research* is a series of authoritative volumes which aim to meet this need. It is an attempt to establish a critical mass of oncology literature covering virtually all oncology topics, revised frequently to keep the coverage up to date, easily available on a single library shelf or by a single personal subscription. We have approached the problem in the following fashion: First, by dividing the oncology literature into specific subdivisions such as lung cancer, genitourinary cancer, pediatric oncology, etc. Second, by asking eminent authorities in each of these areas to edit a volume on the specific topic on an annual or biannual basis. Each topic and tumor type is covered in a volume appearing frequently and predictably, discussing current diagnosis, staging, markers, all forms of treatment modalities, basic biology, and more. *Current Catalog* National Library of Medicine (U.S.), First multi-year cumulation covers six years 1965-70. *Cytokines in Cancer Therapy* L.
