**Analysis I** Terence Tao, 2016-08-29 This is part one of a two volume book on real analysis and is intended for senior undergraduate students of mathematics who have already been exposed to calculus The emphasis is on rigour and foundations of analysis Beginning with the construction of the number systems and set theory the book discusses the basics of analysis limits series continuity differentiation Riemann integration through to power series several variable calculus and Fourier analysis and then finally the Lebesgue integral These are almost entirely set in the concrete setting of the real line and Euclidean spaces although there is some material on abstract metric and topological spaces The book also has appendices on mathematical logic and the decimal system The entire text omitting some less central topics can be taught in two quarters of 25-30 lectures each The course material is deeply intertwined with the exercises as it is intended that the student actively learn the material and practice thinking and writing rigorously by proving several of the key results in the theory

**Elementary and Analytic Theory of Algebraic Numbers** Wladyslaw Narkiewicz, 2013-06-29 The aim of this book is to present an exposition of the theory of algebraic numbers excluding class field theory and its consequences There are many ways to develop this subject the latest trend is to neglect the classical Dedekind theory of ideals in favour of local methods However for numerical computations necessary for applications of algebraic numbers to other areas of number

theory the old approach seems more suitable although its exposition is obviously longer On the other hand the local approach is more powerful for analytical purposes as demonstrated in Tate's thesis Thus the author has tried to reconcile the two approaches presenting a self-contained exposition of the classical standpoint in the first four chapters and then turning to local methods In the first chapter we present the necessary tools from the theory of Dedekind domains and valuation theory including the structure of finitely generated modules over Dedekind domains In Chapters 2, 3 and 4 the classical theory of algebraic numbers is developed Chapter 5 contains the fundamental notions of the theory of  $p$ -adic fields and Chapter 6 brings their applications to the study of algebraic number fields We include here Shafarevich's proof of the Kronecker-Weber theorem and also the main properties of adèles and ideles
