Arbib, 2012-04-11 Unlike any other species humans can learn and use language This book explains how the brain evolved to make language possible through what Michael Arbib calls the Mirror System Hypothesis Because of mirror neurons monkeys chimps and humans can learn by imitation but only complex imitation which humans exhibit is powerful enough to support the breakthrough to language This theory provides a path from the openness of manual gesture which we share with nonhuman primates through the complex imitation of manual skills pantomime protosign communication based on conventionalized manual gestures and finally to protospeech The theory explains why we humans are as capable of learning sign languages as we are of learning to speak This fascinating book shows how cultural evolution took over from biological evolution for the transition from protolanguage to fully fledged languages The author explains how the brain mechanisms that made the original emergence of languages possible perhaps 100 000 years ago are still operative today in the way children acquire language in the way that new sign languages have emerged in recent decades and in the historical processes of language change on a time scale from decades to centuries Though the subject is complex this book is highly readable providing all the necessary background in primatology neuroscience and linguistics to make the book accessible to a general audience      [An Introduction to Formal Language Theory](#) Robert N. Moll, Michael A. Arbib, A.J. Kfoury, 2012-12-06 The study of formal languages and of related families of automata has long been at the core of theoretical computer science Until recently the main reasons for this centrality were connected with the specification and analysis of programming languages which led naturally to the following questions How might a grammar be written for such a language How could we check whether a text were or were not a well formed program generated by that grammar How could we parse a program to provide the structural analysis needed by a compiler How could we check for ambiguity to ensure that a program has a unique analysis to be passed to the computer This focus on programming languages has now been broadened by the increasing concern of computer scientists with designing interfaces which allow humans to communicate with computers in a natural language at least concerning problems

in some well delimited domain of discourse The necessary work in computational linguistics draws on studies both within linguistics the analysis of human languages and within artificial intelligence The present volume is the first textbook to combine the topics of formal language theory traditionally taught in the context of programming languages with an introduction to issues in computational linguistics It is one of a series The AKM Series in Theoretical Computer Science designed to make key mathematical developments in computer science readily accessible to undergraduate and beginning graduate students
