Birdsall, A.B Langdon, 2004-10-01 Divided into three main parts the book guides the reader to an understanding of the basic concepts in this fascinating field of research Part 1 introduces you to the fundamental concepts of simulation It examines one dimensional electrostatic codes and electromagnetic codes and describes the numerical methods and analysis Part 2 explores the mathematics and physics behind the algorithms used in Part 1 In Part 3 the authors address some of the more complicated simulations in two and three dimensions The book introduces projects to encourage practical work Readers can download plasma modeling and simulation software the ES1 program with implementations for PCs and Unix systems along with the original FORTRAN source code p BodyText2 Now available in paperback Plasma Physics via Computer Simulation is an ideal complement to plasma physics courses and for self study *Space Plasma Simulation* Jörg Büchner, Christian Dum, Manfred Scholer, 2008-01-11 The aim of this book is twofold to provide an introduction for newcomers to state of the art computer simulation techniques in space plasma physics and an overview of current developments Computer simulation has reached a stage where it can be a highly useful tool for guiding theory and for making predictions of space plasma phenomena ranging from microscopic to global scales The various articles are arranged as much as possible according to the derlying simulation technique starting with the technique that makes the least number of assumptions a fully kinetic approach which solves the coupled set of Maxwell s equations for the electromagnetic eld and the equations of motion for a very large number of charged particles electrons and ions in this eld Clearly this is also the computationally most demanding model Therefore

even with present day high performance computers it is the most restrictive in terms of the space and time domain and the range of particle parameters that can be covered by the simulation experiments It still makes sense therefore to also use models which due to their simplifying assumptions seem less realistic although the effect of these assumptions on the outcome of the simulation experiments needs to be carefully assessed

Simulation of Manufacturing Sequences of Functionally Graded Structures Gleim, Tobias, 2017-02-10 The current paper establishes an axisymmetric model for an inductive heating process Therein the fully coupled MAXWELL equations assuming a temperature dependent permeability are combined with the non linear heat conduction equation to yield a monolithic solution strategy The latter is based on a consistent linearization together with a higher order finite element discretization using GALERKIN S method in space For the temporal discretization the generalized Newmark methods higher order RUNGE KUTTA methods and discontinuous and continuous GALERKIN methods are used Furthermore the residual error is introduced to open an alternative way to obtain a numerically efficient estimation of the time integration accuracy Simulation results of the electric magnetic and thermal fields are provided together with parameter studies concerning spatial discretization frequency dependence and penetration depth of the heating zone Another topic analyzed is the residual error

and its estimation quality regarding polynomial degree and time step size A further aspect of this work is the investigation of the thermal fluid structure interaction with respect to functionally graded materials Different coupling strategies for the acceleration of the fixed point iteration in each time step is in the foreground Relaxation methods as well as extrapolation methods make it possible to significantly reduce the number of fixed point iterations At the same time an adaptive strategy with higher order RUNGE KUTTA methods can provide a further advantage in combination with acceleration methods
