Graphene and VLSI Interconnects Cher-Ming Tan, Udit Narula, Vivek Sangwan, 2021-11-24 Copper Cu has been used as an interconnection material in the semiconductor industry for years owing to its best balance of conductivity and performance. However, it is running out of steam as it is approaching its limits with respect to electrical performance and reliability. Graphene is a non-metal material but it can help to improve electromigration (EM) performance of Cu because of its excellent properties. Combining graphene with Cu for very large scale integration (VLSI) interconnects can be a viable solution. The incorporation of graphene into Cu allows the present Cu fabrication back end process to remain unaltered except for the small step of inserting graphene into Cu. Therefore, it has a great potential to revolutionize the VLSI integrated circuit (VLSI IC) industry and appeal for further advancement of the semiconductor industry. This book is a compilation of comprehensive studies done on the properties of graphene and its synthesis methods suitable for applications of VLSI interconnects. It introduces the development of a new method to synthesize graphene wherein it not only discusses the method to grow graphene over Cu but also allows the reader to know how to optimize graphene growth using statistical design of experiments (DoE) on Cu interconnects in order to obtain good quality and reliable interconnects. It provides a basic understanding of graphene-Cu interaction mechanism and evaluates the electrical and EM performance of graphenated Cu interconnects.

MICROELECTRONIC INTERCONNECTIONS AND MICROASSEMBLY WORKSHOP 18-21 May 1996 Prague, Czech Republic

Conference Organizers: George Harman (NIST USA) and Pavel Mach (Czech Republic)

Summary of the Technical Program: Thirty-two presentations were given in eight technical sessions at the Workshop. A list of these sessions and their chairpersons is attached below. The Workshop was devoted to the technical aspects of advanced interconnections and microassembly but also included papers on the education issues required to prepare students to work in these areas. In addition to new technical developments, several papers presented overviews predicting the future directions of these technologies. The basic issue is that electronic systems will continue to be miniaturized and at the same time performance must continue to improve. Various industry roadmaps were discussed as well as new smaller packaging and interconnection concepts. The newest chip packages are often based on the selection of an appropriate interconnection method. An example is the chip scale package which has horizontal x-y dimensions 20% larger than the actual silicon chip itself. The chip is often flip-chip connected to a micro ball grid array but direct chip attach was described also. Several papers described advances in the manufacture of such packages.

Copper Interconnect Technology

Tapan Gupta, 2010-01-22 Since overall circuit performance has depended primarily on transistor properties previous efforts to enhance circuit and system speed were focused on transistors as well During the last decade however the parasitic resistance capacitance and inductance associated with interconnections began to influence circuit performance and will be the primary factors in the evolution of nanoscale ULSI technology Because metallic conductivity and resistance to electromigration of bulk copper Cu are better than aluminum use of copper and low k materials is now prevalent in the international microelectronics industry As the feature size of the Cu lines forming interconnects is scaled resistivity of the lines increases At the same time electromigration and stress induced voids due to increased current density become significant reliability issues Although copper low k technology has become
