Detection and Data Fusion Pramod K. Varshney, 2012-12-06 This book provides an introductory treatment of the fundamentals of decision making in a distributed framework Classical detection theory assumes that complete observations are available at a central processor for decision making More recently many applications have been identified in which observations are processed in a distributed manner and decisions are made at the distributed processors or processed data compressed observations are conveyed to a fusion center that makes the global decision Conventional detection theory has been extended so that it can deal with such distributed detection problems A unified treatment of recent advances in this new branch of statistical decision theory is presented Distributed detection under different formulations and for a variety of detection network topologies is discussed This material is not available in any other book and has appeared relatively recently in technical journals The level of presentation is such that the book can be used as a graduate level textbook Numerous examples are presented throughout the book It is assumed that the reader has been exposed to detection theory The book will also serve as a useful reference for practicing engineers and researchers I have actively pursued research on distributed detection and data fusion over the last decade which ultimately interested me in writing this book Many individuals have played a key role in the completion of this book *Algorithms for Discrete Fourier Transform and Convolution* Richard Tolimieri, Myoung An, Chao Lu, 2013-03-09 This book is based on several courses taught during the years 1985-1989 at the City College of the City University of New York and at Fudan University Shanghai China in the summer of 1986 It was originally our intention to present to a mixed audience of electrical engineers mathematicians and computer scientists at the graduate level a collection of algorithms that would serve to represent the vast array of algorithms designed over the last twenty years for computing the finite Fourier transform FFT and finite convolution However it was soon apparent that the scope of the course had to be greatly expanded For researchers interested in the design of new algorithms a deeper understanding of the basic mathematical concepts underlying algorithm design was essential At the same time a large gap remained between the statement of an algorithm and the implementation of the algorithm The main goal of this text is to describe tools that can serve both of these needs In fact it is our belief that certain mathematical ideas provide a natural language and culture for understanding unifying and implementing a wide range of digital signal processing DSP algorithms This belief is reinforced by the complex and time consuming effort required to write code for recently available parallel and vector machines A significant part of this text is devoted to establishing rules and procedures that reduce and at times automate this task **Lectures on Discrete Time Filtering** R.S. Bucy, 2012-12-06 The theory of linear discrete time filtering started with a paper by Kolmogorov in 1941 He addressed the problem for stationary random sequences and introduced the idea of the innovations process which is a useful tool for the more general problems considered here The reader may object and note that Gauss discovered least squares much earlier however I want to distinguish between the

problem of parameter estimation the Gauss problem and that of Kolmogorov estimation of a process This separation is of more than academic interest as the least squares problem leads to the normal equations which are numerically ill conditioned while the process estimation problem in the linear case with appropriate assumptions leads to uniformly asymptotically stable equations for the estimator and the gain The conditions relate to controllability and observability and will be detailed in this volume In the present volume we present a series of lectures on linear and nonlinear sequential filtering theory The theory is due to Kalman for the linear colored observation noise problem in the case of white observation noise it is the analog of the continuous time Kalman Bucy theory The discrete time filtering theory requires only modest mathematical tools in counterpoint to the continuous time theory and is aimed at a senior level undergraduate course The present book organized by lectures is actually based on a course that meets once a week for three hours with each meeting constituting a lecture

Mathematics of Multidimensional Fourier Transform

Algorithms Richard Tolimieri, Myoung An, Chao Lu, 2012-12-06 The Fourier transform of large multidimensional data sets is an essential computation in many scientific and engineering fields including seismology X ray crystallography radar sonar and medical imaging Such fields require multidimensional arrays for complete and faithful modelling Classically a set of data is processed one dimension at a time permitting control over the size of the computation and calling on well established 1 dimensional programs The rapidly increasing availability of powerful computing chips vector processors multinode boards and parallel machines has provided new tools for carrying out multidimensional computations Multidimensional processing offers a wider range of possible implementations as compared to 1 dimensional the greater flexibility of movement in the data in processing due to dexting set This increased freedom along with the massive size data sets typically found in multidimensional applications places intensive demands on the communication aspects of the computation The writing of code that takes into account all the algorithmic possibilities and matches these possibilities to the communication capabilities of the target architecture is an extremely time consuming task A major goal of this text is to provide a sufficiently abstract
