Linux Cluster Architecture:

Linux Cluster Architecture, 2002 The combination of several computers into a single system image is the way of the future. The alternative multiprocessor systems using a specialized operating system is often too inefficient and too costly in the long run. Today's solution is to combine several single processors over an inexpensive network. Called cluster architecture, this solution requires careful planning and sophisticated application software. *Linux Cluster Architecture* helps system designers and administrators learn the essential skills associated with Linux cluster architecture, internetworking, integration, operating system configuration, and application software development. *Linux Cluster Architecture* Alex Vrenios, 2002

Cluster computers provide a low cost alternative to multiprocessor systems for many applications. Building a cluster computer is within the reach of any computer user with solid C programming skills and a knowledge of operating systems, hardware, and networking. This book leads you through the design and assembly of such a system and shows you how to measure and tune its overall performance. A cluster computer is a multicomputer, a network of node computers running distributed software that makes them work together as a team. Distributed software turns a collection of networked computers into a distributed system. It presents the user with a single system image and gives the system its personality. Software can turn a network of computers into a transaction processor, a supercomputer, or even a novel design of your own. Some of the techniques used in this book's distributed algorithms might be new to many readers, so several of the chapters are dedicated to such topics. You will learn about the hardware needed to network several PCs, the operating system files that need to be changed to support that network, and the multitasking and the interprocess communications skills needed to put the network to good use. Finally, there is a simple distributed transaction processing application in the book. Readers can experiment with it, customize it, or use it as a basis for something completely different. *Grid and Cooperative Computing* Minglu Li, Xian-He Sun, Qianni Deng, Jun Ni, 2004-04-19

Grid and cooperative computing has emerged as a new frontier of information technology. It aims to share and coordinate distributed and heterogeneous network resources for better performance and functionality that can otherwise not be achieved. This volume contains the papers presented at the 2nd International Workshop on Grid and Cooperative Computing, GCC 2003, which was held in Shanghai, P. R. China, during December 7-10, 2003. GCC is designed to serve as a forum to present current and future work as well as to exchange research ideas among researchers, developers, practitioners, and users in grid computing, web services, and cooperative computing, including theory and applications. For this workshop, we received over 550 paper submissions from 22 countries and regions. All the papers were peer reviewed in depth and qualitatively graded on their relevance, originality, significance, presentation, and the overall appropriateness of their acceptance. Any concerns raised were discussed by the program committee. The organizing committee selected 176 papers for conference presentation (full papers) and 173 submissions for poster presentation (short papers). The papers included herein represent the forefront of research from China, USA, UK, Canada, Switzerland, Japan.
