processing in order to understand the 3D space or scene that they depict This is a result of research into how to use input from image sensors such as television cameras as a basis for learning about a 3D scene thereby replicating the sense of vision for humans or intelligent robots and this has been the central problem in image processing research since the 1970s However a completely different type of image with its own new problems the 3D digital image discussed in this book rapidly took prominence in the 1980s particularly in the field of medical imaging These were recordings of human bodies obtained through computed or computerized tomography CT images that recorded not only the external visible surface of the subject but also to some degree of resolution its internal structure This was a type of image that no one had experienced before
