Foundational Issues In Natural Language Processing:

Foundational Issues in Natural Language Processing Peter Sells, Stuart M. Shieber, Thomas Wasow, 1991 Four separate essays address the complex and difficult connections among grammatical theory mathematical linguistics and the operation of real natural language processing systems both human and electronic William Rounds Avarind Joshi Janet Fodor and Robert Berwick are leading scholars in the multidisciplinary field of natural language processing In four separate essays they address the complex and difficult connections among grammatical theory mathematical linguistics and the operation of real natural language processing systems both human and electronic The editors substantial introduction details the progress and problems involved in attempts to relate these four areas of research William Rounds discusses the relevance of complexity results to linguistics and computational linguistics providing useful caveats about how results might be misinterpreted and pointing out promising avenues of future research Avarind Joshi with K Vijay Shanker and David Weir surveys results showing the equivalence of several different grammatical formalisms all of which are mildly context sensitive with special attention to variants of tree adjoining grammar Janet Fodor discusses how psycholinguistic results can bear on the choice among competing grammatical theories surveying a number of recent experiments and their relevance to issues in grammatical theory Robert Berwick considers the relationship between issues in linguistic theory and the construction of computational parsing systems in particular the question of what it means to implement a theory of grammar in a computational system He argues for the advantages of a principle based approach over a rule based one and surveys several recent parsing systems based on the theory of government and binding

The Oxford Handbook of Computational Linguistics Ruslan Mitkov, 2022-05-23 Ruslan Mitkov s highly successful Oxford Handbook of Computational Linguistics has been substantially revised and expanded in this second edition Alongside updated accounts of the topics covered in the first edition it includes 17 new chapters on subjects such as semantic role labelling text to speech synthesis translation technology opinion mining

and sentiment analysis and the application of Natural Language Processing in educational and biomedical contexts among many others The volume is divided into four parts that examine respectively the linguistic fundamentals of computational linguistics the methods and resources used such as statistical modelling machine learning and corpus annotation key language processing tasks including text segmentation anaphora resolution and speech recognition and the major applications of Natural Language Processing from machine translation to author profiling The book will be an essential reference for researchers and students in computational linguistics and Natural Language Processing as well as those working in related industries

Foundation Models for Natural Language Processing Gerhard Paaß, Sven Giesselbach, 2023-05-23 This open access book provides a comprehensive overview of the state of the art in research and applications of Foundation Models and is intended for readers familiar with basic Natural Language Processing NLP concepts Over the recent years a revolutionary new paradigm has been developed for training models for NLP These models are first pre trained on large collections of text documents to acquire general syntactic knowledge and semantic information Then they are fine tuned for specific tasks which they can often solve with superhuman accuracy When the models are large enough they can be instructed by prompts to solve new tasks without any fine tuning Moreover they can be applied to a wide range of different media and problem domains ranging from image and video processing to robot control learning Because they provide a blueprint for solving many tasks in artificial intelligence they have been called Foundation Models After a brief introduction to basic NLP models the main pre trained language models BERT GPT and sequence to sequence transformer are described as well as the concepts of self attention and context sensitive embedding Then different approaches to improving these models are discussed such as expanding the pre training criteria increasing the length of input texts or including extra knowledge An overview of the best performing models for about twenty application areas is then presented e g question answering translation story generation dialog systems generating images from text etc For each application area the strengths and weaknesses of current models are discussed and an outlook on further developments is given In addition links are provided to freely available program code A concluding chapter summarizes the economic opportunities mitigation of risks and potential developments of AI

Philosophy, Language, and Artificial Intelligence J. Kulas, J.H. Fetzer, T.L. Rankin, 2012-12-06 This series will include monographs and collections of studies devoted to the investigation and exploration of knowledge information and data processing systems of all kinds no matter whether human other animal or machine Its scope is intended to span the full range of interests from classical problems in the philosophy of mind and philosophical psychology through issues in cognitive psychology and socio biology concerning the mental capabilities of other species to ideas related to artificial intelligence and computer science While primary emphasis will be placed upon theoretical conceptual and epistemological aspects of these problems and domains empirical experimental and methodological studies will also appear from time to time Among the most challenging and difficult projects within the scope

of artificial intelligence is the development and implementation of computer programs suitable for processing natural language. Our purpose in compiling the present volume has been to contribute to the foundations of this enterprise by bringing together classic papers devoted to crucial problems involved in understanding natural language which range from issues of formal syntax and logical form to those of possible worlds and situation semantics. The book begins with a comprehensive introduction composed by Jack Kulas, the senior editor of this work which provides a systematic orientation to this complex field and ends with a selected bibliography intended to promote further research. If our efforts assist others in dealing with these problems they will have been worthwhile. J. H. F.

Current Issues in Mathematical Linguistics C. Martín-Vide, 2014-06-28

The present volume contains some selected topics of current interest around the world in the mathematical analysis of natural language. The book is divided into four sections: analytical algebraic models, models from the theory of formal grammars and automata with interest mainly in syntax, model theoretic concepts in semantics or pragmatics and a final section containing some applications in computational linguistics. The varied perspectives illustrated in the book confirm that Mathematical Linguistics has finally introduced scientific methods into a previously fuzzy field through the use of mathematical reasoning. The text will contribute to a fruitful convergence between linguists, mathematicians, logicians, computer scientists, cognitive scientists and others interested in the formal treatment of natural language and the research of its properties.
