## Fatou Type Theorems:

**Fatou Type Theorems** F. Di Biase,1997-12-01    *Fatou Type Theorems* Fausto Di Biase,1998 A basic principle governing the boundary behaviour of holomorphic functions and harmonic functions is this Under certain growth conditions for almost every point in the boundary of the domain these functions admit a boundary limit if we approach the boundary point within certain approach regions For example for bounded harmonic functions in the open unit disc the natural approach regions are nontangential triangles with one vertex in the boundary point and entirely contained in the disc Fat06 In fact these natural approach regions are optimal in the sense that convergence will fail if we approach the boundary inside larger regions having a higher order of contact with the boundary The first theorem of this sort is due to J E Littlewood Lit27 who proved that if we replace a nontangential region with the rotates of any fixed tangential curve then convergence fails In 1984 A Nagel and E M Stein proved that in Euclidean half spaces and the unit disc there are in effect regions of convergence that are not nontangential These larger approach regions contain tangential sequences as opposed to tangential curves The phenomenon discovered by Nagel and Stein indicates that the boundary behaviour of holomorphic functions and harmonic functions in theorems of Fatou type is regulated by a second principle which predicts the existence of regions of convergence that are sequentially larger than the natural ones

**Two-dimensional Ornstein-Uhlenbeck Processes** Peter Des Barres March,1983    The Hodge-Laplacian Dorina Mitrea,Irina Mitrea,Marius Mitrea,Michael Taylor,2025-01-27 The core of this monograph is the development of tools to derive well posedness results in very general geometric settings for elliptic differential operators A new generation of Calderon Zygmund theory is developed for variable coefficient singular integral operators which turns out to be particularly versatile in dealing with boundary value problems for the Hodge Laplacian on uniformly rectifiable subdomains of Riemannian manifolds via boundary layer methods In addition to absolute and relative boundary conditions for differential forms this monograph treats the Hodge Laplacian equipped with classical Dirichlet Neumann Transmission Poincaré and Robin boundary conditions in regular Semmes Kenig Toro domains The 1 st edition of the Hodge Laplacian De Gruyter Studies in Mathematics Volume 64 2016 is a trailblazer of its kind having been written at a time when new results in Geometric Measure Theory have just emerged or were still being developed In particular this monograph is heavily reliant on the bibliographical items The latter was at the time an unpublished manuscript which eventually developed into the five volume series Geometric Harmonic Analysis published by Springer 2022 2023 The progress registered on this occasion greatly impacts the contents of the Hodge Laplacian and warrants revisiting this monograph in order to significantly sharpen and expand on previous results This also allows us to provide specific bibliographical references to external work invoked in the new edition Lying at the intersection of partial differential equations harmonic analysis and differential geometry this text is suitable for a wide range of PhD students researchers and professionals

### **Harmonic Functions on Trees and Buildings**

Adam Korányi (et al.), Donald I. Cartwright, 1997 This volume presents the proceedings of the workshop Harmonic Functions on Graphs held at the Graduate Centre of CUNY in the autumn of 1995. The main papers present material from four minicourses given by leading experts D. Cartwright, A. Fig, Talamanca, S. Sawyer and T. Steger. These minicourses are introductions which gradually progress to deeper and less known branches of the subject. One of the topics treated is buildings which are discrete analogues of symmetric spaces of arbitrary rank. Buildings of rank are trees. Harmonic analysis on buildings is a fairly new and important field of research. One of the minicourses discusses buildings from the combinatorial perspective and another examines them from the  $p$ -adic perspective. The third minicourse deals with the connections of trees with  $p$ -adic analysis and the fourth deals with random walks, i.e., with the probabilistic side of harmonic functions on trees. The book also contains the extended abstracts of 19 of the 20 lectures given by the participants on their recent results. These abstracts, well detailed and clearly understandable, give a good cross section of the present state of research in the field.

*From Bessel To Multi-index Mittag-Leffler Functions: Enumerable Families, Series In Them And Convergence* Jordanka Pancheva-konovska, 2016-08-25. Bessel and Mittag-Leffler functions are prominent within mathematical and scientific fields due to increasing interest in non conventional models within applied mathematics. Since the analytical solutions of many differential and integral equations of arbitrary order can be written as series of special functions of fractional calculus they are now unavoidable tools for handling various mathematical models of integer or fractional order. *From Bessel to Multi Index Mittag Leffler Functions* analyzes this through the study of enumerable families of different classes of special functions. Enumerable families are considered and the convergence of series is investigated. Providing a unified approach to the classical power series analogues of the classical results for the power series are obtained and the conclusion is that each of the considered series has a similar convergence behavior to a power series. Also studied are various properties of the Bessel and Mittag-Leffler functions and their generalizations including estimations, asymptotic formulae, fractional differentiation and integration operators.

**Non-Archimedean Variable** Robert L. Benedetto,2019-03-05 The theory of complex dynamics in one variable initiated by Fatou and Julia in the early twentieth century concerns the iteration of a rational function acting on the Riemann sphere Building on foundational investigations of p adic dynamics in the late twentieth century dynamics in one non archimedean variable is the analogous theory over non archimedean fields rather than over the complex numbers It is also an essential component of the number theoretic study of arithmetic dynamics This textbook presents the fundamentals of non archimedean dynamics including a unified exposition of Rivera Letelier s classification theorem as well as results on wandering domains repelling periodic points and equilibrium measures The Berkovich projective line which is the appropriate setting for the associated Fatou and Julia sets is developed from the ground up as are relevant results in non archimedean analysis The presentation is accessible to graduate students with only first year courses in algebra and analysis under their belts although some previous exposure to non archimedean fields such as the p adic numbers is recommended The book should also be a useful reference for more advanced students and researchers in arithmetic and non archimedean dynamics
