

The logarithmic potential has been widely studied as an example of an non-axisymmetric potential, giving the kind of orbits one might find in elliptical galaxies:

$$\Phi(R, z) = \frac{1}{2}v_0^2 \ln \left(R_c^2 + R^2 + \frac{z^2}{q^2} \right), \quad (1)$$

where $R = \sqrt{x^2 + y^2}$ and R_c (the “core radius”), q (the flattening parameter, e.g. $q = 1$ gives a spherical potential, $q < 1$ gives an ellipsoidal potential) and v_0 are constants. Orbits in this potential fall into two main categories: **box**-type orbits and **loop** orbits.

Question 1

- a) Write down the equations of motion for a test particle moving in this potential (*Hint: use cartesian coordinates and write down the equation of motion for each component of position separately*)
- b) Derive the circular velocity in the equatorial plane ($z = 0$) of this potential, and its value for $R \gg R_c$
- c) Compute the epicyclic frequency κ for a nearly circular orbit in the equatorial plane of this potential. Write κ in terms of Ω .
- d) Find the 3D density distribution corresponding to this potential
