Filter Design With Time Domain Mask Constraints Theory And Applications:

Filter Design With Time Domain Mask Constraints: Theory and Applications Ba-Ngu Vo, Antonio Cantoni, Kok Lay Teo, 2013-03-09 Optimum envelope constrained filter design is concerned with time domain synthesis of a filter such that its response to a specific input signal stays within prescribed upper and lower bounds while minimizing the impact of input noise on the filter output or the impact of the shaped signal on other systems depending on the application In many practical applications such as in TV channel equalization digital transmission and pulse compression applied to radar sonar and detection the soft least square approach which attempts to match the output waveform with a specific desired pulse is not the most suitable one Instead it becomes necessary to ensure that the response stays within the hard envelope constraints defined by a set of continuous inequality constraints The main advantage of using the hard envelope constrained filter formulation is that it admits a whole set of allowable outputs From this set one can then choose the one which results in the minimization of a cost function appropriate to the application at hand The signal shaping problems so formulated are semi infinite optimization problems This monograph presents in a unified manner results that have been generated over the past several years and are scattered in the research literature The material covered in the monograph includes problem formulation numerical optimization algorithms filter robustness issues and practical examples of the application of envelope constrained filter design Audience Postgraduate students researchers in optimization and telecommunications engineering and applied mathematicians

Mecklenbräuker, Franz Hlawatsch, 1997-10-08

In the last two decades the field of time frequency analysis has evolved into a widely recognized and applied discipline of signal processing Besides linear time frequency representations such as the short time Fourier transform the Gabor transform and the wavelet transform an important contribution to this development has undoubtedly been the Wigner distribution WD which holds an exceptional position within the field of bilinear quadratic time frequency representations The WD was first defined in quantum mechanics as early as 1932 by the later Nobel laureate E Wigner In 1948 J Ville introduced this concept in signal analysis Based on investigations of its mathematical structure and properties by N G de Bruijn in 1967 the WD was brought to the attention of a larger signal processing community in 1980 The WD was soon recognized to be important for two reasons firstly it provides a powerful theoretical basis for quadratic time frequency analysis secondly its discrete time form supplemented by suitable windowing and smoothing is an eminently practical signal analysis tool The seven chapters of this book cover a wide range of different aspects of the WD and other linear time frequency distributions properties such as positivity spread and interference term geometry signal synthesis methods and their application to signal design time frequency filtering and signal separation WD based analysis of nonstationary random processes singular value decompositions and their application to WD based detection and classification and optical applications of the WD The size of the chapters has been chosen such that an in depth treatment of the various topics is achieved **Dissertation Abstracts**
