Fundamentals of Transportation Systems Analysis ,1976 Fundamentals of Transportation Systems Analysis Marvin L. Manheim,1979-06 Transportation systems analysis is a multidisciplinary field which draws on engineering economics operations research political science psychology management and other disciplines The major text synthesizes from these fields an approach that is intellectually coherent and comprehensive Numerous details are provided to indicate how major concepts can be applied in practice to particular modes and problems But the major objective of this book is to provide the reader with a basic framework onto which many different areas of specialization can be added by later coursework and practical experience Fundamentals of Transportation Systems Analysis identifies concepts that are truly fundamental to serious work in the planning design or management of transportation systems It also emphasizes through more detailed treatment certain topics such as transportation demand and performance and the processes of evaluation and choice that are inadequately treated in the available literature A unique feature of the book is its emphasis on multimodal solutions to transportation problems The student is taught to view the transportation system as a unified whole and to evaluate it within the context of the overall social economic and political system of a given region According to Professor Manheim The challenge of transportation systems analysis is to intervene delicately and deliberately in the complex fabric of a society to use transport effectively in coordination with other public and private actions to achieve the goals of that society
