

Climate change

- Improve self-report assessment of environmental exposure
- Improve assessment of objective environmental exposure
- Improve assessment of interactions between different types of environmental exposure and the relationship between exposure and pre-existing vulnerabilities and adaptive capacities
- Improve the use of geospatial modelling techniques

Mental health

- Improve the use of time-series design (eg. lag models, inclusion of appropriate confounders)
- Take a systems-thinking approach and use complex systems method
- Use projection studies and modelling (while bearing in mind uncertainty of estimates)
- Use experimental and quasi-experimental designs
- Measure the ancillary effects of mitigation and adaptation strategies on mental health
- Use detection and attribution studies
- Use randomised and non-randomised designs to test interventions' effectiveness
- Use quantitative implementation indicators to guide programme implementation among growing climate stressors

- Move beyond hospitalisation and mortality (covering the entire mental health spectrum of mental health problem severity and good mental health)
- Improve operationalisation of emergent climate change and mental health constructs (eg. climate anxiety)
- Include transdiagnostic and dimensional mental health indicators
- Improve assessment of mental health using self-report measures
- Use proxy measures (eg. social media data)

Context

- Improve use of confounders
- Understand how other environmental and social determinants (eg. poverty) interact with climate change and mental health
- Investigate the effect of other planetary exposures (eg. biodiversity loss and land-system changes)
