Radioactive particles have been released to the environment from a number of sources including nuclear weapon tests nuclear accidents and discharges from nuclear installations Particle characteristics influence the mobility biological uptake and effects of radionuclides hence information on these characteristics is essential for assessing environmental impact and risks This publication presents a series of papers covering sources and source term characterisation methodologies for characterizing particles and the impact of particles on the behaviour of radioactive particles in the environment Sources covered include the Chernobyl accident nuclear weapons accidents at Thule and

Palomares accident the discharges from Dounreay and Krashnoyarsk and depleted uranium in Kosovo and Kuwait The overall aim is that an increased understanding of particle characteristics and behavior will help to reduce some of the uncertainties in environmental impact and risk assessment for particle contaminated areas

**Environmental Mineralogy II** D.J. Vaughan, R.A. Wogelius, 2013-02-06 In a sense all mineralogy is environmental mineralogy However the term environmental has come to be employed particularly in

combination with terms such as science issue or problem to refer to those systems at or near the surface of the Earth where the geosphere comes into contact with the hydrosphere atmosphere and biosphere This is of course the environment upon which the human race depends for survival and hence is now sometimes referred to as the critical zone Those systems containing minerals that constitute the most important or key environments are considered here soils modern sediments atmospheric aerosols and the interior or exterior parts of certain micro and macro organisms Particularly important are the roles that minerals play in processes that act over time to control or influence the environment at various scales of observation Both pure systems and those contaminated as a result of human activity are considered The objectives for this volume are to help to define the subject of environmental mineralogy and to provide an initial source of information both for mineralogists and other scientists who wish to understand or work in this field It was hoped that it might also provide a text for use by those teaching courses in the subject at advanced undergraduate or graduate student level

Analysis of Environmental Radionuclides Pavel P. Povinec, 2011-07-28 The purpose of this book is to present a state of art summary of current knowledge of methods of assessment of radionuclides in the terrestrial and marine environments It covers the traditional methods of radioactivity measurements such as radiometrics techniques but also recent developments in the mass spectrometry sector The book starts with a short preface introducing the subject of the book summarising content and philosophy of the book as well as the most important historical achievements The scientific topics are introduced by description of sampling methods optimisation of sampling sites and sampling frequency The recent developments in radiochemical separation methods using chromatography resins for the treatment of actinides transuranics and other groups of radioelements are also described No other book is available covering all aspects of environmental radioactivity measurements although remarkable progress has been made in detection techniques over the last ten years At

present the new methods enable to carry out investigations which were not possible before either because of lack of sensitivity or because of the fact that they required too large samples
