**Beyond the Green Revolution** Kenneth Dahlberg,2012-12-06 This book which is the result of an intellectual odyssey began as an attempt to explore and map the environmental and cross cultural dimensions of the continuing spread of the green revolution that package of high yielding varieties of grain fertilizers irrigation and pesticides that constitutes the core of modern industrial agriculture In the process of traversing the terrain of several intellectual traditions and cutting through various disciplinary forests and thickets a number of striking observations were made all leading to two sober ing conclusions First most intellectual maps dealing with agriculture fail to recognize it as the basic interface between human societies and their environment Because of this they are little better than the flat earth maps of earlier centuries in helping to understand global realities Second when agriculture is analyzed from a global perspec tive that takes evolution seriously one sees that the ecological risks as well as the energy and social costs of modern industrial agriculture make it largely inappropriate for developing countries Beyond that one can see a great need within industrialized countries to develop less costly less risky and more sustainable agricultural alternatives Early in the journey it became clear that conventional disciplinary approaches were inadequate to comprehend the scope and diversity of global agriculture and that a new multilevel approach was needed It also became clear that any new approach would have to try to correct certain Western biases and blind spots      Groundwater Contamination: Use of Models in Decision-Making G. Jousma,Jacob Bear,Y.Y.

Haimes,F. Walter,2012-12-06 The protection of groundwater resources has emerged in recent years as a high priority topic on the agenda of many countries In responding to the growing concern over deteriorating groundwater quality many countries are developing a comprehensive regulatory framework for the management of subsurface water resources with management referring to both quantity and quality aspects Within this framework groundwater models are rapidly coming to playa central role in the development of protection and rehabilitation strategies These models provide forecasts of the future state of the groundwater aquifer systems and or the unsaturated zone in response to proposed management initiatives For example models will predict the effects of implementing a proposed management scheme on water levels and on the transport and fate of pollutants The models are now used in the formulation of policies and regulations the issuing of permits design of monitoring and data collection systems and the development of enforcement actions The growth in the use of these sophisticated tools has led to many unforeseen problems in groundwater management Lingering issues include reliability of codes quality assurance in model development and applications efficient utiliza tion of human and material resources

its citizens Similarly countries endeavor to protect their citizens and undertake energy policies that will assure either a continuation of the existing quality of life or particularly in the case of Third World countries a marked improvement in quality of life These competing and conflicting goals call for a study which encompasses the whole world Again complexity is piled upon complexity If the problem is not yet sufficiently complex there is an equally complex question of the effect of energy production and use on the ecology
