Office of Radiation Programs, 1972 The Guide recommends methods for conducting a minimum level of environmental radiation surveillance outside the plant site boundary of light water cooled nuclear power facilities

*Detecting Environmental Radioactivity* Manuel García-León, 2022-11-30 This textbook presents the principles and methods for the measurement of radioactivity in the environment In this regard specific low level radiation counting and spectrometry or mass spectrometry techniques are discussed including sources distribution levels and dynamics of radioactivity in nature The author gives an accurate description of the fundamental concepts and laws of radioactivity as well as the different types of detectors and mass spectrometers needed for detection Special attention is paid to scintillators semiconductor detectors and gas ionization detectors In order to explain radiochemistry some concepts about chemical separations are introduced as well The book is meant for graduate and advanced undergraduate students in physics chemistry or engineering oriented to environmental sciences and to other disciplines where monitoring of the environment and its management is of great interest Research on Environmental Radioactivity Gülçin BİLGİCİ CENGİZ, Mehmet Ertan

Office of Radiation Programs,1973      *Low-Level Environmental Radioactivity* Richard Tykva,Jozef Sabol,1995-04-13 From the Introduction Low level radioactivity is related to those radioactive sources of ionizing radiation that are characterized by low activities Sometimes activity here does not represent total amount of radionuclides but rather their concentration In other cases the total activity may be quite high but we can measure only a relatively small portion of the material Low may have for different situations and circumstances not only considerably different meanings but also different absolute values as far as the activity or activity concentration is concerned For example one can refer to low activity in the case of radiocarbon dating where the concentration of  $^{14}\text{C}$  is actually lower than its natural concentration and also in the case of radon monitoring where especially in mines or in some enclosed spaces its concentration may be several thousand times higher than the outdoor natural concentrations Emphasis is now being placed on the analysis of naturally occurring radionuclides in the environment or on the release of radionuclides from their different man made sources because liquid and aerial discharge level controls have become more rigorous In addition the applicability of low level methodology increases the extent of different radionuclide applications considerably Since individual radionuclides differ in their decay scheme and particles emitted as well in their energies there is no universal method for the accurate measurement of all radioactive sources Moreover there is usually a mixture of radionuclides in a sample causing some difficulties in a selective evaluation of a given radionuclide Due to the random nature of radioactive disintegrations the appropriate interpretation of the experimental results would be in most cases impossible without elaborate statistical treatment and evaluation of the data obtained Thanks to the availability of computer based instrumentation the measuring data can be in most cases processed and evaluated on line which makes it possible to control and optimize the experiment in order to extract the maximum amount of information carried by the detector response The purpose of this book is to provide an introduction to low level radioactivity assessment and to clarify the nature of its sources as well as the principal methods used in its measurement Our evaluation is concentrated on the present day aspects of low level methodology The book may be useful for all who need highly sensitive analysis of natural or artificial radioactivity both within and outside the nuclear field The attempt of this book is to summarize the sources of environmental radioactivity and their possible radiological impact in terms of resulting doses to the population and to present a sound review of the measuring methods and techniques for the evaluation of low level radioactivities encountered in both the environment and in a number of applications where radioactive sources are used as a means of obtaining important information

**Environmental Radioactivity and Emergency Preparedness** Mats Isaksson, Christopher L. Raaf, 2017-01-06

Radioactive sources such as nuclear power installations can pose a great threat to both humans and our environment. How do we measure, model and regulate such threats? *Environmental Radioactivity and Emergency Preparedness* addresses these topical questions and aims to plug the gap in the lack of comprehensive literature in this field. The book explores how to deal with the threats posed by different radiological sources including those that are lost or hidden and the issues posed by the use of such sources. It presents measurement methods and approaches to model and quantify the extent of threat and also presents strategies for emergency preparedness such as strategies for first responders and radiological triage in case an accident should happen. Containing the latest recommendations and procedures from bodies such as the IAEA, this book is an essential reference for both students and academicians studying radiation safety as well as for radiation protection experts in public bodies or in the industry.

**Radioecology: Lectures In Environmental Radioactivity** E Holm, 1994-08-31. These lectures presented by experts from the Nordic countries are collected with the purpose of education in the field of environmental radioactivity. The book may be used in university courses on e.g. health physics and environmental science. Administrators and managers of environmental programmes may also find useful background information. The book covers all important aspects of environmental radioactivity such as source terms, atmospheric transport processes in aquatic and terrestrial systems, radiochemistry and measurement techniques, radioactivity in man, modeling and assessment of absorbed doses. The Nordic Committee for Nuclear Safety Research (NKS) organises joint research programmes such as the above lectures to strive for a better understanding in the Nordic countries of factors influencing nuclear safety, radiation protection and emergency provisions.

**Effluent and environmental radiation surveillance** J. J. Kelly, 1980      **Man-Made and Natural Radioactivity in Environmental Pollution and Radiochronology** Richard Tykva, Dieter Berg, 2013-03-14

Radioactivity can be detected at different levels in almost all objects all over the world including the human body. This omnipresence of naturally occurring radioactivity is of immediate and crucial concern to people who work in the nuclear industry, to state and local authorities responsible for environmental protection and control of nuclear weapons, and to researchers in physics, e.g. interaction in scientific and technological disciplines such as radiation with matter, chemistry, e.g. management of radioactive wastes, biology, e.g. radiation bioeffects and risks, ecology, e.g. remediation of environmental pollution, electronics, e.g. measurement instruments, etc. Unlike other environmental pollutants such as heavy metals and pesticides, some other scientific disciplines, for example archaeology, hydrology, and geology, profit by the environmental radionuclides using methods based on their application in radiochronology. The basic goal of this book is to examine the complex state of radioactivity in the environment including its sources and applications. In principle, there are two sources of environmental radioactivity, namely man-made and natural. The authors of this book set out to analyze mainly empirical aspects of the activities of both groups. On one hand, a detailed analysis of the sources releasing radionuclides into the environment by human activities should, while describing environmental pollution and its dangers, contribute to its decrease in the future.

Environmental Radioactivity from Natural, Industrial, and Military Sources is the comprehensive source of information on radiation in the environment and human exposure to radioactivity. This Fourth Edition is a complete revision and extension of the classic work reflecting major new developments and concerns as the Cold War ended, nuclear weapons began to be dismantled, and cleanup of the nuclear weapons facilities assumed center stage. Contamination from accidents involving weapons reactors and radionuclide sources are discussed in an updated chapter including the latest information about the effects of the Chernobyl accident. Important revisions are also made to the chapters on natural radioactivity, nuclear fuels, and power reactors, radioactive waste management, and various other sources of exposure. Several chapters provide primers for readers who may not be familiar with the fundamentals of radiation biology, protection standards, and pathways for the environmental transport of radionuclides. An Appendix lists the properties of the more important radionuclides found in the environment. The book concludes with a commentary on contemporary social aspects of radiation exposure and risks that offers an alternative view to current, often excessive, concerns over radiation, nuclear technology, and waste.

**Key Features:** Describes every important source of environmental radioactivity. Reviews the vexing problems of radioactive waste management and cleanup of contaminated sites. Contains measured or projected

radiation dose estimates for the major sources Features 126 figures 80 tables and more than 1200 references Discusses current problems in historical context The two authors bring more than 75 years of combined experience with environmental radioactivity Provides an understanding of the sources of environmental radioactivity and human exposure from the mining of ores to final disposal of wastes Thoroughly reviews important contamination accidents     Upgrading Environmental Radiation Data Health Physics Society.
