Aggarwal, Joel R. Gat, Klaus F. Froehlich, 2007-08-31 Environmental isotope and nuclear techniques provide unmatched insights into the processes governing the water cycle and its variability This monograph presents state of the art applications and new developments of isotopes in hydrology environmental disciplines and climate change studies Coverage ranges from the assessment of groundwater resources in terms of recharge and flow regime to studies of the past and present global environmental and climate changes Groundwater Modelling in Arid and Semi-Arid Areas Howard S. Wheater, Simon A. Mathias, Xin Li, 2010-09-09 Arid and semi arid regions face major challenges in the management of scarce freshwater resources under pressures of population economic development climate change pollution and over abstraction Groundwater is commonly the most important water resource in these areas Groundwater

models are widely used globally to understand groundwater systems and to guide decisions on management. However, the hydrology of arid and semi arid areas is very different from that of humid regions and there is little guidance on the special challenges of groundwater modelling for these areas. This book brings together the experience of internationally leading experts to fill a gap in the scientific and technical literature. It introduces state of the art methods for modelling groundwater resources illustrated with a wide ranging set of illustrative examples from around the world. The book is valuable for researchers, practitioners in developed and developing countries and graduate students in hydrology, hydrogeology, water resources management, environmental engineering and geography.

Groundwater Hydrology of Springs Neven Kresic, Zoran Stevanovic, 2009-08-29

Groundwater Hydrology of Water Resource Series. Water is an essential environmental resource and one that needs to be properly managed. As the world places more emphasis on sustainable water supplies, the demand for expertise in hydrology and water resources continues to increase. This series is intended for professional engineers who seek a firm foundation in hydrology and an ability to apply this knowledge to solve problems in water resource management. Future books in the series are: Groundwater Hydrology of Springs 2009, Groundwater Hydrology of River Basins 2009, Groundwater Hydrology of Aquifers 2010 and Groundwater Hydrology of Wetlands 2010.

First utilized as a primary source of drinking water in the ancient world, springs continue to supply many of the world's cities with water. In recent years, their long term sustainability is under pressure due to an increased demand from groundwater users. Edited by two world renowned hydrologists, **Groundwater Hydrology of Springs: Theory, Management and Sustainability** will provide civil and environmental engineers with a comprehensive reference for managing and sustaining the water quality of springs. With contributions from experts from around the world, this book covers many of the world's largest springs, providing a unique global perspective on how engineers around the world are utilizing engineering principles for coping with problems such as mismanagement, overexploitation and their impacts, both water quantity and quality. The book will be divided into two parts: part one will explain the theory and principles of hydrology as they apply to springs, while part two will provide a rare look into the engineering practices used to manage some of the most important springs from around the world. Description of the spring and the aquifer feeding it; Latest groundwater and contaminant transport models; Description of sources of aquifer use; Understanding of contamination and or possible contamination; A plan for management and sustainability.

Groundwater Science and Policy, 2008. Until recently, focus on groundwater mainly concerned its use as drinking water and as an important resource for industry, e.g. cooling waters and agriculture irrigation. It has, however, become increasingly obvious that groundwater should not only be viewed as a drinking water reservoir but that it should also be protected for its environmental value. In this respect, groundwater represents an important link of the hydrological cycle through the maintenance of wetlands and river flows acting as a buffer through dry periods. Hence, deterioration of groundwater quality may directly affect other related aquatic

and terrestrial ecosystems The groundwater legislative framework under the EU Water Framework Directive and the newly adopted Groundwater Directive establishes criteria linked to environmental objectives which have to be met by 2015 following successive operational steps including characterisation risk assessment analysis of pressures and impacts monitoring and design of programmes of measures These milestones require that sound technical and scientific information be made accessible to water managers which is so far still not sufficiently streamlined In this context this book describes the groundwater legislative milestones and presents series of research and development activities that aim to directly support them It has therefore the ambition to become a vehicle liaising policy requirements and available scientific knowledge in this area

Sustaining Groundwater Resources J. Anthony A. Jones, 2011-07-21 Burgeoning population and climate change are among the most critical challenges facing the 21st century Both have critical implications for groundwater resources especially in many developing countries where resources are already under pressure Due to low rainfall and high evaporation in parts of the Middle East and North Africa groundwater is not being renewed and groundwater laid down up to 10 000 years ago is literally being mined for irrigation often very inefficiently Over recent decades groundwater levels have fallen dramatically in key grain growing regions like the American Great Plains and the North China Plain As the population grows and emerging economies like China and India demand more food especially water intensive meat products agricultural demand for water is set to increase The rapid shift of population from the countryside to the cities is also adding to this pressure most old wells in Beijing are now dry Pollution from industry agriculture and shanty towns is destroying many groundwater resources some could take 50 years to clean up even with strict and immediate controls This volume looks at the technical socio economic and political problems being faced and at the developments in groundwater science and management that may help create a sustainable future for our planet
