Promising an end to global hunger and political instability huge climate controlled laboratories known as phytotrons spread around the world to thirty countries after the Second World War The United States built nearly a dozen including the first at Caltech in 1949 Made possible by computers and other novel greenhouse technologies of the early Cold War phytotrons enabled plant scientists to experiment on the environmental causes of growth and development of living organisms Subsequently they turned biologists into technologists who in their pursuit of knowledge about plants also set out to master the machines that controlled their environment Engineering the Environment tells the forgotten story of a research program that revealed the shape of the environment the limits of growth and development and the limits of human control over complex technological systems As support and funding for basic science dwindled in the mid 1960s phytotrons declined and ultimately disappeared until nearly thirty years later the British built the Ecotron to study the impact of climate change on biological communities By revisiting this history of phytotrons David Munns reminds us of the vital role they can play in helping researchers unravel the complexities of natural ecosystems in the Anthropocene **Atrium** Charles Rice,2023-10-17

How the rise of the large scale atrium space in the 1970s and 80s changed the way buildings could be designed constructed regulated and occupied In the 1970s a void opened at the heart of architecture In hotels offices public buildings and commercial centers the atrium emerged globally to challenge the modernist legacies of form and function altering the pattern and experience of cities While often appearing at vast scale and to striking effect the atrium also became omnipresent and mundane In this lively critique Charles Rice charts the atrium s appearance in the 1970s and its development through the 1980s as it accompanied profound shifts in the discipline and practice of architecture During this period architectural practice especially in the United States and United Kingdom was changing rapidly due in part to the manifold effects of deregulation All aspects of the way buildings were designed developed regulated built managed and occupied were being reshaped A practice guided by the progressive tenets of modernism was being turned into a professional service fully integrated within neoliberal social and economic imperatives As Rice shows the atrium gives this story a distinct spatial and material figure one that offers an inside view of architecture in transformation Horticultural Science Jules Janick,1986-02-15 Resource added for the Landscape Horticulture Technician program 100014 **U.S.**
