**Kinematics and Environmental Forces** Society for Underwater Technology (SUT), 2013-03-14 In determining the response of offshore structures it is of utmost importance to determine in the most correct manner all factors which contribute to the total force acting on these structures Applying the Morison formula Morison et al 1950 to calculate forces on offshore slender structures uncertainties related to the understanding of the wave climate the hydrodynamic force coefficients and the kinematics of ocean waves represent the most important contributions to the uncertainties in the prediction of the total forces on these structures Haver and Gudmestad 1992 Traditional calculation of forces on offshore structures involves the use of regular waves with the following non linearities incorporated use of regular wave theories incorporating higher order terms use of Morison equation having a nonlinear drag term inclusion of the effect of the free surface by integrating all contributions to total forces and moments from the sea floor to the free surface of the waves In order to describe the sea more realistically the ocean surface is to be described as an irregular sea surface represented by its energy spectrum The associated decomposition of the sea surface is given as a linear sum of linear waves The total force is found by integrating the contribution from all components in the wave spectrum to the free surface The kinematics of each component must therefore be determined Dynamics of Fixed Marine Structures N. D. P. Barltrop, A. J. Adams, 2013-10-22 Dynamics of Fixed Marine Structures Third Edition proves guidance on the dynamic design of fixed structures subject to wave and current action The text is an update of the UR8 design guide Dynamics of Marine Structures with discussion of foundations wind turbulence offshore installations earthquakes and strength and fatigue The book employs analytical methods of static and dynamic structural analysis techniques particularly the statistical and spectral methods when applied to loading and in the calculating dynamic responses The statistical methods are explained when used to wave wind and earthquake calculations together with the problems encountered in actual applications Of importance to fixed offshore platforms are the soil properties and foundation covering soil behavior site investigation testing seabed stability gravity structures and the use of single piles Methods of forecasting measuring and modeling of waves and currents are also presented in offshore structure construction Basic hydrodynamics is explained in understanding wave theory and some description is given to forecasting of environmental conditions that will affect the structures The effects of vortex induced vibrations on the structure are explained and the three methods that can prevent vortex induced oscillations are given Wind turbulence or wind loads are analyzed against short natural period or long natural periods of structures The transportation of offshore platforms installation and pile driving including examples of the applications found in the book are given as well The guide is helpful for offshore engineers designers of inshore jetties clients needing design and analysis work specialists related to offshore

Wu,1991 **SUBTECH '91** Society for Underwater Technology (SUT),2012-12-06 The concept of using flexible reelable pipe to transport liquids gases and vapours is not a new one As early as the 1940s a steel braided elastomeric pipeline was developed for the Allied Forces in order to transport fuels to support the Normandy Beachheads In fact the longest flexible pipeline ever constructed is likely to be that laid across the English Channel as part of Operation Pluto The methodology used to handle and instal such pipe is also not new Ellis 1943 London in an early patent specification identifies three basic objectives for a flexible pipelining method These are prefabrication of the pipe onshore coiling of the pipe on suitable drums or reels and using such reels to lay pipe from anchored or motorised barges The design concept for flexible pipe is also not a new invention given that flexible hoses and umbilicals have been in service for more than sixty years A break through was however achieved by the French Institute of Petroleum in the early 1970s when they developed an improved steel reinforced pipe structure having a high axial loading capacity which utilised corrosion and hydrocarbon resistant polymers to extend pipe service lifetime This early pipe design utilised established cable making techniques to apply steel armour and axially and radially reinforce alternating layers of polymer sheaths The pipe was primarily developed as a flowline for use in static seabed applications Innovations in the Analysis and Design of Marine Structures Yordan Garbatov,C.
