Advanced Rail Geotechnology - Ballasted Track Buddhima Indraratna, Cholachat Rujikiatkamjorn, Wadud Salim, 2023-08-14 Ballast plays a vital role in transmitting and distributing the train wheel loads to the underlying track substructure The load bearing capacity safe train speed and the levels of noise and vibration as well as passenger comfort depend on the behaviour of ballast through particle interlocking and the corresponding deformation of this granular assembly Attrition and breakage of ballast occur progressively under heavy and continual cyclic loading causing track deterioration and rail misalignment affecting safety while exacerbating the intensity of track maintenance In the absence of realistic computational models the track substructure is traditionally designed using mostly empirical approaches In this book the authors present the detailed information on the strength deformation and degradation aspects of fresh and recycled ballast under monotonic cyclic and impact loading using innovative geotechnical testing devices A constitutive model for ballast incorporating particle breakage is presented representing a more realistic stress strain response The mathematical formulations and numerical models are validated using controlled experimental simulations and fully instrumented field trials Revised ballast gradation is described to provide greater track resiliency and extended longevity The book also provides a detailed description of geosynthetics for substructure improvement considering track deterioration caused by particle

Earth Structures Ivan Vanicek, Martin Vanicek, 2008-05-30 One of the plausible perceptions about safe and generally optimal geotechnical structure leads to the conclusion that its success is supported by four columns The first column relies on the understanding of natural sciences such as Geology Engineering Geology and Hydrogeology on one side and on the understanding of Mechanics Theory of Elasticity on the other side The second column relies on the application of existing findings on the behaviour of soils and rocks under different stress strain states we are speaking about support from Soil Mechanics and Rock Mechanics The third column relies on the combination of the theoretical findings with practical technologies during execution of Foundation Engineering and Underground Structures Tunnelling Finally the fourth column relies on a certain feeling of geological environment which Terzaghi 1959 denotes as capacity for judgment and he specifies that this capacity can be gained only by years of contact with field conditions The authors are confident that the third column relevant to practical application should be strengthened about Earth Structures about application on structures which belong to the oldest engineering structures utilizing the fundamental structural material soil At the same time they believe that Earth Structures will establish their position in the near future as it is gaining another interesting field which Earth Structures are also part of namely the field of Environmental Geotechnics
