Collin, N. Justin

Marshall,2008-04-08 Research on sensory processing or the way animals see hear smell taste feel and electrically and magnetically sense their environment has advanced a great deal over the last fifteen years This book discusses the most important themes that have emerged from recent research and provides a summary of likely future directions The book starts with two sections on the detection of sensory signals over long and short ranges by aquatic animals covering the topics of navigation communication and finding food and other localized sources The next section the co evolution of signal and sense deals with how animals decide whether the source is prey predator or mate by utilizing receptors that have evolved to take full advantage of the acoustical properties of the signal Organisms living in the deep sea environment have also received a lot of recent attention so the next section deals with visual adaptations to limited light environments where sunlight is replaced by bioluminescence and the visual system has undergone changes to optimize light capture and sensitivity The last section on central co ordination of sensory systems covers how signals are processed and filtered for use by the animal This book will be essential reading for all researchers and graduate students interested in sensory systems *Color Constancy* Marc

Ebner,2007-06-05 A human observer is able to recognize the color of objects irrespective of the light used to illuminate them This is called color constancy A digital camera uses a sensor to measure the reflected light meaning that the measured color at each pixel varies according to the color of the illuminant Therefore the resulting colors may not be the same as the colors that were perceived by the observer Obtaining color constant descriptors from image pixels is not only important for digital photography but also valuable for computer vision color based automatic object recognition and color image processing in general This book provides a comprehensive introduction to the field of color constancy describing all the major color constancy algorithms as well as presenting cutting edge research in the area of color image processing Beginning with an in depth look at the human visual system Ebner goes on to examine the theory of color image formation color reproduction and different color spaces discuss algorithms for color constancy under both uniform and non uniform illuminants describe methods for shadow removal and shadow attenuation in digital images evaluate the various algorithms for object recognition and color constancy and compare this to data obtained from experimental psychology set out the different algorithms as pseudo code in an appendix at the end of the book *Color Constancy* is an ideal reference for practising engineers computer scientists and researchers working in the area of digital color image processing It may also be useful for biologists or scientists in general who are interested in computational theories of the visual brain and bio inspired engineering systems

Nineteenth-Century Science A.S. Weber, 2000-03-10 Nineteenth Century Science is a science anthology which provides over 30 selections from original 19th century scientific monographs textbooks and articles written by such authors as Charles Darwin Mary Somerville J W Goethe John Dalton Charles Lyell and Hermann von Helmholtz The volume surveys scientific discovery and thought from Jean Baptiste Lamarck s theory of evolution of 1809 to the isolation of radium by Marie and Pierre Curie in 1898 Each selection opens with a biographical introduction situating each scientist and discovery within the context of history and culture of the period Each entry is also followed by a list of further suggested reading on the topic A broad range of technical and popular material has been included from Mendeleev s detailed description of the periodic table to Faraday s highly accessible lecture for young people on the chemistry of a burning candle The anthology will be of interest to the general reader who would like to explore in

detail the scientific cultural and intellectual development of the nineteenth century as well as to students and teachers who specialize in the science literature history or sociology of the period The book provides examples from all the disciplines of western science chemistry physics medicine astronomy biology evolutionary theory etc The majority of the entries consist of complete unabridged journal articles or book chapters from original 19th century scientific texts Neuroscience and Art Amy Ione,2024-08-27 This book is focused on how understanding ourselves as humans is incomplete without considering both biological and cultural aspects Using the neurocultural perspective the book explores how everything in the world is filtered back and forth through the brain and culture The thrust of the book therefore is to explore the power of art in creating a bridge between cultural and neuroscientific lines of inquiry Looking at both clinical and non clinical populations the text examines historical foundations distinguishes congenital developmental conditions from those that are acquired and emphasizes how the brain constructs our sensory experiences Several distinctive features separate this research from other publications First the book opens with a review of how the historical literature is still etched into the ideas we employ to explain elements across the interdisciplinary fields of art aesthetics our sensory experience psychology cognition and well being Second the research adopts a humanistic rather than a philosophical or social science perspective in demonstrating the value of coupling anatomy and physiology with the natural and social environment In this artists from all genres are incorporated Among them are Iris Murdoch Ludwig van Beethoven Leonardo da Vinci Cristoforo de Predis Rembrandt Federico Fellini Chuck Close and David Hockney Case studies demonstrate how neuroscientific research meshes with art individual and cultural variables in ways that range from health and well being to physiological decline and biological traumas These include a case study that examines how Oliver Sacks combined biology and biography in his writings It also explores art projects in several genres inspired by his studies Another case study is on the role of film as a useful clinical tool Here the book also demonstrates that cinematic devices used by filmmakers intersect with perceptual and cognitive neuroscience A defining feature of the analysis is the integration of research on brain injuries with humanistic responses in film literature and the visual arts This section outlines the lack of consensus regarding the causes and treatment of shell shock in World War I before introducing how research and art now work with PTSD TBI Finally the book examines therapeutic cases of professional and non professional artists concluding with a discussion of synesthesia and the senses

Handbook of Color

Psychology Andrew J. Elliot, Mark D. Fairchild, Anna Franklin, 2015-12-17 We perceive color everywhere and on everything that we encounter in daily life. Color science has progressed to the point where a great deal is known about the mechanics, evolution, and development of color vision, but less is known about the relation between color vision and psychology. However, color psychology is now a burgeoning, exciting area, and this Handbook provides comprehensive coverage of emerging theory and research. Top scholars in the field provide rigorous overviews of work on color categorization, color symbolism and association, color preference, reciprocal relations between color perception and psychological functioning, and variations and deficiencies in color perception. The Handbook of Color Psychology seeks to facilitate cross-fertilization among researchers both within and across disciplines and areas of research and is an essential resource for anyone interested in color psychology in both theoretical and applied areas of study.
