**CLC 2018: Carpathian Logistics Congress , Location Theory** Stefan Nickel,Justo Puerto,2006-01-16 Although modern location theory is now more than 90 years old the focus of researchers in this area has been mainly problem oriented However a common theory which keeps the essential characteristics of classical location models is still missing This monograph addresses this issue A flexible location problem called the Ordered Median Problem OMP is introduced For all three main subareas of location theory continuous network and discrete location structural properties of the OMP are presented and solution approaches provided Numerous illustrations and examples help the reader to become familiar with this new location model By using OMP classical results of location theory can be reproved in a more general and sometimes even simpler way Algorithms enable the reader to solve very flexible location models with a single implementation In addition the code of some algorithms is available for download

*Operations Management* Antonella Petrillo,Fabio De Felice,Germano Lambert-Torres,Erik Bonaldi,2021-03-03 Global competition has caused fundamental changes in the competitive environment of the manufacturing and service industries Firms should develop strategic objectives that upon achievement result in a competitive advantage in the market place The forces of globalization on one hand and rapidly growing marketing opportunities overseas especially in emerging economies on the other have led to the expansion of operations on a global scale The book aims to cover the main topics characterizing operations management including both

*Networks in Action* Gerard Sierksma, Diptesh Ghosh, 2009-12-11 One of the most well known of all network optimization problems is the shortest path problem where a shortest connection between two locations in a road network is to be found This problem is the basis of route planners in vehicles and on the Internet Networks are very common structures they consist primarily of a finite number of locations points nodes together with a number of links edges arcs connections between the locations Very often a certain number is attached to the links expressing the distance or the cost between the end points of that connection Networks occur in an extremely wide range of applications among them are road networks cable networks human relations networks project scheduling networks production networks distribution networks neural networks networks of atoms in molecules In all these cases there are objects and relations between the objects A network optimization problem is actually nothing else than the problem of finding a subset of the objects and the relations such that a certain optimization objective is satisfied

**Operations Research in Space and Air** Tito A. Ciriani, G. Fasano, S. Gliozzi, Roberto Tadei, 2013-04-18

Operations Research in Space and Air is a selection of papers reflecting the experience and expertise of international OR consulting companies and academic groups. The global market and competition play a crucial part in the decision making processes within the Space and Air industries and this book gives practical examples of how advanced applications can be used by Space and Air industry management. The material within the book provides both the basic background for the novice modeler and a useful reference for experienced modelers. Students, researchers and OR practitioners will appreciate the details of the modeling techniques, the processes that have been implemented and the computational results that demonstrate the benefits in applying OR in the Space and Airline industries. Advances in PC and Workstations technology in optimization engines and in modeling techniques now enable solving problems never before attained by Operations Research. In recent years the Italian OR Society AfRO [www.airo.org](http://www.airo.org) has organized annual forums for researchers and practitioners to meet together to present and discuss the various scientific and technical OR achievements. The OR in Space & Air session of AfRO2001 and AfRO2002 Conferences together with optimization tools applications presented recent results achieved by Alenia Spazio S.p.A. Turin, Alitalia Milan Polytechnic and Turin Polytechnic. With additional contributions from academia and industry they have enabled us to capture in print today's state of the art optimization and data mining solutions.

Supply Chain Security Andrzej Szymonik, Robert Stanisławski, 2022-08-18. Contemporary supply chains operate under the pressure of customer requirements increasing price competition, sudden increases or decreases in demand, unforeseen obstacles and new threats. The right way to improve the functioning of the flow of material and accompanying information is not only the continuous collection of data but also their collection, analysis, inference and decision making with the use of decision support systems, expert systems and artificial intelligence. Such procedures make it easier for logisticians not only to forecast processes but also to predict, forecast and identify potential problems and facilitate the implementation of optimal modern solutions, paying attention to current trends in the supply chain market. An important issue that affects the quality, efficiency and availability, continuity of the processes implemented within the supply chain is security. This is an area that is not clearly defined. This book uses theoretical and practical knowledge to define security in the supply chain as a state that gives a sense of certainty and guarantees the flow of material goods and services in accordance with the 7w rule as well as a smooth flow of information for the planning and management of logistics processes. Tools and instruments used to ensure the security of the supply chain contribute to the protection and survival in times of dangerous situations, threats and adaptation to new conditions, susceptibility to unplanned situations. When analyzing the needs and structure of the 21st century supply chains in the context of their security, it is impossible to ignore the problem of their digitization which enables the determination of optimal routes and the anticipation of possible threats, crisis situations. Automatic data exchange between various departments of the company along the upper and lower part of the supply chain improves the functioning of the warehouse management through, among others, automation, robotization and pro activity. It also contributes to efficient good

communication and market globalization Automation also brings new extremely attractive business models with regard to occupational safety ergonomics and environmental protection To meet the needs of creating modern supply chains the book analyzes and presents current and future solutions that affect security and the continuity of supply chains *Proceedings of the Eleventh International Forum on Decision Sciences* Xiang Li,Xiaofeng Xu,2024 Zusammenfassung This book focuses on selected aspects of the current and upcoming trends in transportation logistics and decision making In detail the included transportation management optimization and management of logistics system big data technology and method financial engineering and risk management investment decision and risk management data driven process management decision scheduling optimization and combination decision theory and method of forecasting and decision making data mining and knowledge management operation and green supply chain management industrial engineering and operation management information system and business intelligence Internet green manufacturing strategic emerging industries and industrial finance big data and smart city The variety of the papers delivers added value for both scholars and practitioners This book is the documentation of the symposium The Eleventh International Forum on Decision Sciences which took place in Qingdao Shandong Province China Extreme Values, Regular Variation and Point Processes Sidney I.
