7th Int. Conf. Industrial & En Frank D. Anger,Rita V. Rodriguez,Moonis Ali,1994-05-23 Over the years the promise of artificial intelligence has inspired many researchers and many schemes only to have incipient hopes thwarted by its complexity With each generation of

computational engines a new wave of enthusiasm sweeps the community as solutions to a few problems come within reach. However, intractability and undecidability continue to frustrate the unwary practitioner while unsubstantiated methodologies offer ingenious solutions that hold more promise than potential. Despite its undulate past and variegated present, AI has made solid contributions to a growing information technology. Expert systems and allied tools have become a mainstay of industrial and business organizations; intelligent interfaces have increased accessibility of computational resources; and robotic innovations have redefined the manufacturing industries. Meanwhile, research in evolutionary algorithms, neural networks, fuzzy reasoning, and other exciting approaches promise continued progress in surprising new directions. These proceedings record the latest results of industrial, commercial, military, and academic artificial intelligence exploration. Seventy-seven papers, divided into twenty different areas, document a significant slice of this broad and exciting field. Although dozens of themes are treated in the papers, the topical divisions of this volume comprise:

- The Software Engineering AI Interface
- Knowledge Based Systems
- Temporal Reasoning
- Machine Learning
- Robotics
- Intelligent Databases
- Planning
- Expert Systems
- Applications
- Search Techniques
- Genetic and Evolutionary Methods
- Design
- Qualitative Reasoning
- Neural Networks
- Knowledge Representation
- Application Paradigms
- Fuzzy and Pattern Recognition
- Reasoning about Physical Systems
- Parallel and Distributed AI
- and Diagnostic Systems

*Constraint-based Reasoning* Eugene C. Freuder, Alan K. Mackworth, 1994

Constraint-based reasoning is an important area of automated reasoning in artificial intelligence with many applications. These include configuration and design problems, planning and scheduling, temporal and spatial reasoning, defeasible and causal reasoning, machine vision, and language understanding, qualitative and diagnostic reasoning, and expert systems. Constraint-Based Reasoning presents current work in the field at several levels: theory, algorithms, languages, applications, and hardware. Constraint-based reasoning has connections to a wide variety of fields, including formal logic, graph theory, relational databases, combinatorial algorithms, operations research, neural networks, truth maintenance, and logic programming. The ideal of describing a problem domain in natural declarative terms and then letting general deductive mechanisms synthesize individual solutions has to some extent been realized and even embodied in programming languages.
