A unique overview of research on dyslexia and an account of the underlying causes at cognitive brain and neural system levels that provides a framework for significant progress in the understanding of dyslexia and other related learning disabilities Dyslexia research has made dramatic progress since the mid 1980s Once discounted as a middle class myth dyslexia is now the subject of a complex and confusing body of theoretical and empirical research In *Dyslexia Learning and the Brain* leading dyslexia researchers Roderick Nicolson and Angela Fawcett provide a uniquely broad and coherent analysis of dyslexia theory Unlike most dyslexia research which addresses the question what is the cause of the reading disability called dyslexia the authors work has addressed the deeper question of what is the cause of the learning disability that manifests as reading problems This perspective allows them to place dyslexia research within the much broader disciplines of cognitive psychology and cognitive neuroscience and has led to a rich framework including two established leading theories the automatization deficit account 1990 and the cerebellar deficit hypothesis 2001 Nicolson and Fawcett show that extensive evidence has accumulated to support these two theories and that they may be seen as subsuming the established phonological deficit account and sensory processing accounts Moving to the explanatory level of neural systems they argue that all these disorders reflect problems in some component of the procedural learning system a multiregion system including major components of cortical and subcortical regions The authors answer to the fundamental question what is dyslexia offers a challenge and motivation for research throughout the learning disabilities laying the foundations for future progress      *Language, Learning, and Behavior Disorders* Joseph H.
