interactive decision analysis based on advanced information processing systems *Applied Decision Analysis and Economic Behaviour* Andrew J. Hughes Hallett, 2012-12-06 The optimisation of economic systems over time and in an uncertain environment is central to the study of economic behaviour The behaviour of rational decision makers whether they are market agents firms or governments and their agencies is governed by decisions designed to secure the best outcomes subject to the perceived information and economic responses including those of other agents Economic behaviour has therefore to be analysed in terms of the outcomes of a multiperiod stochastic optimisation process containing four main components the economic responses the dynamic constraints represented by an economic model the objective function the goals and their priorities the conditioning information expected exogenous events and the expected future state of the economy and risk management how uncertainties are accommodated The papers presented in this book all analyse some aspect of economic behaviour related to the objectives information or risk components of the decision process While the construction of economic models obviously also has a vital role to play that component has received much greater or almost exclusive attention elsewhere These papers examine optimising behaviour in a wide range of economic problems both theoretical and applied They reflect a variety of concerns economic responses under rational expectations the Lucas critique and optimal fiscal or monetary policies market management partly endogenous goals evaluating government reactions locational decisions uncertainty and information structures and forecasting with endogenous reactions **Behavioral and neuroscientific analysis of economic decision making in animals** Tobias Kalenscher, Marijn Van Wingerden, The experimental analysis of animal behavior has a rich tradition in psychology behavioral ecology and many other scientific branches dedicated to the study of decision making However it has never enjoyed a similar popularity in economics This has recently changed with the dawn of neuroeconomics a discipline combining the analytic and experimental tools of psychology and economics with the technologies available in neuroscience to unravel the neurobiological mechanisms underlying economic behavior Since many of the sophisticated neuroscientific techniques can only be used on animals neuroeconomists have come up with a large and ever growing repertoire of animal models to probe economic decision making Besides the value of using animals as model systems to emulate human economic behavior the discipline of animal economic decision making exists in its very own right an abundance of animal species at various evolutionary stages show behavior that complies with many of the predictions of economic theory whilst at the same time demonstrating violations of optimal choice models that are reminiscent of similar anomalies found in human behavior Hence the analysis of animal choice does not only offer insights into the evolutionary origins of economic decision making it also testifies that the analysis of animal behavior is a convenient economical and sound way to test competing economic decision models in optimally controlled experimental environments to probe their neural implementation and to yield common denominators in choice behavior In short economic theory provides more than just an alternative language to describe animal psychology its combination with biology

psychology and neuroscience gives way to synergy effects that open up new venues for studying economic choice In this special issue we would like to gather the latest results from this cross disciplinary topic address the overlap and discrepancies in the neurobiology of economic decision making found between species and identify the challenges that lie ahead in translating results from species to species and ultimately to humans The exclusive focus on non human animals makes this Research Topic unique and distinct from previous special issues which covered a broader range of matters and subjects in the neurobiological analysis of decision making Economic Decision Analysis Wolter J.
