ABSTRACT

The general-purpose simulation package SCoP (Simulation Control Program) was first introduced in 1984 as a hierarchy of procedures to create an interactive simulation program for the IBM Personal Computer from user-written C subroutines describing the desired model equations. Since 1984, SCoP has grown substantially in capabilities and has been ported to larger computers using the UNIX and VMS operating systems. This paper describes version 4, designed for personal computers only. Since the introduction of SCoP, a new high-level input language has been added to greatly simplify the task of specifying the model. Algebraic, differential, and even chemical kinetic equations can be entered directly in natural form. The SCoP language is hierarchical so that a large and complex model can be built up by linking several smaller models tested independently. The user has flexible control over the calculations at run time, including stopping and restarting and changing the effective independent variable. Several options are provided for evaluating the model and comparing its results with experimental data, including the calculation of sensitivities and model identifiability, and automatic parameter fitting with statistics. Version 4 has a new user interface utilizing windows and pull-down menus.

INTRODUCTION

SCoP (Simulation Control Program) was originally written to produce interactive simulation programs for the IBM Personal computer (Kootsey and Holt 1984; Kootsey *et al* 1985). Biomedical simulations required frequent construction of new models and modification of existing models. The creation of custom FORTRAN programs for each new model was too time consuming and existing continuous simulation languages either were not interactive or were not available for small computers.

To build a simulation program with SCoP, the user had to create C subroutines containing the model equations, initial conditions, and a call to the appropriate numerical solver. These subroutines were then compiled and linked to the SCoP sou-

lines and solvers from the accompanying numerical library to produce an executable program. Compilation was chosen for the model equations (rather than interpretation) to obtain maximum computation speed as biological models can be very complex.

The original SCoP simulation program was menu-driven and displayed the results of the calculations in graphic or tabular form as they were calculated. An automatically-created definitions file made it possible for the user to create multi-character variable names for each model that were then used to write the model equations and to select variables or parameters at run time.

Since 1984, numerous features and capabilities have been added to the SCoP package, including automatic parameter fitting, a high-level input language, and many library functions and solvers. The code has also been ported to other machines and operating systems. Releases of version 3, distributed since 1989, run under UNIX and VMS as well as under DOS on IBM Personal Computers and equivalent machines. The SCoP code grew substantially in size and complexity from 1984 to the present, creating problems in maintaining the code. Also, the user interface needed to be modernized, replacing the old-style menus with windows and pull-down menus. A new simulation system being developed for UNIX workstations made it possible to target the new version of SCoP exclusively toward personal computers, modernizing the interface to utilize techniques such as windows and pull-down menus and removing code that had been added to support the other environments. This paper describes features of this new version of SCoP. Many of the features described were added in releases between 1984 and 1990; no attempt will be made to document the date or version in which each feature first appeared.

MODEL DESCRIPTION LANGUAGE

To construct a simulation program with SCoP, the modeler creates a source file (using any text editor) in a high-level language unique to SCoP (Kohn, *et al*, 1990). A two-pass pro-
