This book provides cutting-edge scientific ideas and novel concepts on the ecosystem-based approach to fisheries management. It begins by reviewing the scientific fundamentals and problems currently faced by conventional fisheries science based on population dynamics. In turn, it reviews the theoretical basis of ecosystem dynamics, including selected ecosystem indicators. Surplus production and balanced harvests are discussed in the ecosystem dynamics context. Several ecosystem holistic indicators are described, but particular emphasis is placed on two: the noxicline gain in entropy due to loss of biomass and resilience, which are expressed as ecosystem holistic points of reference for defining allowable harvest rates. Both biological population and ecosystem holistic points of reference are subsequently analyzed in the context of fisheries management and conservation. An adaptability concept is also discussed as a management policy for facing climate change. In closing, the concepts presented are applied to six study cases involving a range of different ecosystems and fisheries. **Public Health and Welfare: Concepts, Methodologies, Tools, and Applications**
