Rapid Thermal Processing Richard B. Fair, 2012-12-02 This is the first definitive book on rapid thermal processing RTP an essential manufacturing technology for single wafer processing in highly controlled environments Written and edited by nine experts in the field this book covers a range of topics for academics and engineers alike moving from basic theory to advanced technology for wafer manufacturing The book also provides new information on the suitability of RTP for thin film deposition junction formation silicides epitaxy and in situ processing Complete discussions on equipment designs and comparisons between RTP and other processing approaches also make this book useful for supplemental information on silicon processing VLSI processing and integrated circuit engineering

Deep Implants: Fundamentals and Applications G.G. Bentini, A. Golanski, S. Kalbitzer, 1989-01-01 Deep implants are produced by the high energy implantation of impurities in a host material The thus created subsurface layers have properties that are different from the very surface and the bulk and show great promise for application in the electronics industry

Reduced Thermal Processing for ULSI R.A. Levy, 2012-12-06 As feature dimensions of integrated circuits shrink the associated geometrical constraints on junction depth impose severe restrictions on the thermal budget for processing such devices Furthermore due to the relatively low melting point of the first aluminum metallization level such restrictions extend to the fabrication of multilevel structures that are now essential in increasing packing density of interconnect lines The fabrication of ultra large scale integrated ULSI devices under thermal budget restrictions requires the reassessment of existing and the development of new microelectronic materials and processes This book addresses three broad but interrelated areas The first area focuses on the subject of rapid thermal processing RTP a technology that allows minimization of processing time while relaxing the constraints on high temperature Initially developed to limit dopant redistribution current applications of RTP are shown here to encompass annealing oxidation nitridation silicidation glass reflow and contact sintering In a second but complementary area advances in equipment design and performance of rapid thermal processing equipment are presented in conjunction with associated issues of temperature measurement and control Defect mechanisms are assessed together with the resulting properties of rapidly deposited and processed films The concept of RTP integration for a full CMOS device process is also examined together with its impact on device characteristics

Volume 100. Materials Research Society Symposium Proceedings Michael J. Aziz,Lynn E. Rehn,Bernd

Stritzker,MATERIALS RESEARCH SOCIETY PITTSBURGH PA.,1988 The material covered in this symposium focused on two distinct areas The first was phase transformations induced by ion or electron bombardment including amorphization and interface motion The second was the behavior of solids during various forms of annealing and quenching ranging in duration from femtoseconds to hours such as rapid solidification following pulsed laser melting and rapid thermal annealing The overlap between these two areas consisted of topics such as motion of the crystal amorphous interface during ion bombardment at elevated temperatures The symposium revealed how these fields have matured over the last decade and highlighted many new and several older yet unanswered questions that might be addressed in future research Keywords Phase transformations Ion bombardment Electron bombardment Annealing Quenching Solidification Interfaces Phase Formation and Modification by Beam-Solid Interactions: Volume 235 Gary S. Time-resolved Diffraction J. R

Helliwell,P. M. Rentzepis,1997-12-18 The acceleration of the technical capabilities of X ray electron and neutron diffraction techniques in recent years has been driven by developments in synchrotron and neutron sources detectors and computers These allow the rapid and repeated acquisition of diffraction data as a chemical and biological structural process proceeds following its initiation This opens up completely new studies from timescales ranging from the sub picosecond at the fastest through all the time domains up to kiloseconds for the slower molecular processes **High Temperature Aluminides and**

Intermetallics S.H. Whang,D.P. Pope,C.T. Liu,2013-10-22 This volume of proceedings is concerned with an increasingly important area that of intermetallics and high temperature aluminides which has recently been attracting a great deal of attention Nearly 150 papers presented at the meeting held in San Diego in September 1991 are reproduced here They cover a wide range of related topics such as the bonding characteristic and alloying behaviour of TiAl intermetallic compounds and the cleavage fracture of ordered intermetallic alloys All the papers have been reviewed according to the standards set by Materials Science and Engineering This book will be of interest to metallurgists and materials scientists working with composites who are interested in the latest developments in this fast moving field Oriented Crystallization on Amorphous Substrates E.I. Givargizov,2013-11-21 Present day science and technology have become increasingly based on studies and applications of thin films This is especially true of solid state physics semiconductor electronics integrated optics computer

science and the like In these fields it is necessary to use films with an ordered structure especially single crystalline films because physical phenomena and effects in such films are most reproducible Also active parts of semiconductor and other devices and circuits are created as a rule in single crystal bodies To date single crystalline films have been mainly epitaxial or heteroepitaxial i e they have been grown on a single crystalline substrate and principal trends e g in the evolution of integrated circuits ICs have been based on continuing reduction in feature size and increase in the number of components per chip However as the size decreases into the submicrometer range technological and physical limitations in integrated electronics become more and more severe It is generally believed that a feature size of about 0.1 μm will have a crucial character In other words the present two dimensional ICs are anticipated to reach their limit of minimization in the near future and it is realized that further increase of packing density and or functions might depend on three dimensional integration To solve the problem techniques for preparation of single crystalline films on arbitrary including amorphous substrates are essential

Photon, Beam and Plasma Assisted Processing E.F. Krimmel, I.W. Boyd, 1989-02-01 This symposium attracted 82 papers which were presented orally or as posters Fourteen invited speakers presented state of the art reviews and aspects of future key topics in this increasingly important area of materials science The high level of scientific presentation during the conference enhanced the aim of the symposium which was to stimulate discussion amongst materials scientists chemists engineers and physicists with a common interest in this field and to disseminate knowledge of progress
