Maritato, 2001-03-15 The ELOISATRON ELN Project aims at a future proton supercollider with 100 500 TeV energy per beam and 1034 1036 cm²s⁻¹ luminosity While the Large Hadron Collider LHC is being implemented at CERN it is very timely to study the feasibility of the next generation of hadron colliders at the extreme limits of energy and luminosity In this respect the achievement of extremely high magnetic fields and the production of accelerating rf cavities with very low losses are a crucial point in the actual construction design of such a collider The search for superconducting materials with suitable properties to be used in this field has gained a new impulse after the discovery of the so called high temperature superconducting compounds HTSCs with superconducting critical temperatures higher than 100 K Besides the critical temperatures the transport performances of this class of compounds are still very far from allowing applications in extremely high energy colliders On the other hand in the last few years the technological and scientific improvements obtained for both the HTSCs and the conventional superconducting materials are very promising This book reviews the recent status of R D on the rising generation of superconducting materials for accelerator magnets and cavities and discusses novel aspects and ideas in this domain **Nano-Crystalline and Thin Film Magnetic Oxides** Ivan Nedkov, Marcel Ausloos, 1999-09-30

Handbook of Superconducting Materials David A. Cardwell, David S. Ginley, 2003 With the advent of High Temperature Superconductivity and the increasing reliability of fabrication techniques superconductor technology has moved firmly into the mainstream of academic and industrial research There is currently no single source of practical information giving guidance on which technique to use for any particular category of superconductor An increasing number of materials scientists and electrical engineers require easy access to practical information sensible advice and guidance on best practice and reliable proven fabrication and characterisation techniques The Handbook will be the definitive collection of material describing techniques for the fabrication and analysis of superconducting materials In addition to the descriptions of techniques authoritative discussions written by leading researchers will give guidance on the most appropriate technique for a particular situation Characterisation and measurement techniques will form an important part of the Handbook providing researchers with a standard reference for

experimental techniques The tutorial style description of these techniques makes the Handbook particularly suitable for use by graduate students The Handbook will be supported by a comprehensive web site which will be updated with new data as it emerges The Handbook has six main sections Fundamentals of Superconductivity characteristic properties elementary theory critical current of type II superconductors Processing bulk materials wires and tapes thick and thin films contact techniques Characterisation Techniques structure microstructure measurement and interpretation of electromagnetic properties measurement of physics properties Materials characteristic properties of low and high T_c materials Applications high current applications trapped flux devices high frequency devices Josephson junction device **High Temperature**
