## ABSTRACT

Software architecture is shaped by a diverse set of interacting and competing quality concerns, each of which may have broad-reaching impacts across multiple architectural views. Without traceability support, it is easy for developers to inadvertently change critical architectural elements during ongoing system maintenance and evolution, leading to architectural erosion. Unfortunately, existing traceability practices, tend to result in the proliferation of traceability links, which can be difficult to create, maintain, and understand. We therefore present a decision-centric approach that focuses traceability links around the architectural decisions that have shaped the delivered system. Our approach, which is informed through an extensive investigation of architectural decisions made in real-world safety-critical and performance-critical applications, provides enhanced support for advanced software engineering tasks.

## 1. INTRODUCTION

Although a carefully designed and robust architecture is necessary for delivering a software system that satisfies its stakeholders' goals and quality concerns, it is not sufficient for guaranteeing that those quality concerns are satisfied over the lifetime of the software system. Unfortunately, ongoing maintenance activities resulting from new or modified requirements, general code re-factorings, performance tweaks, and bug fixes can erode the benefits derived from initial architectural decisions. Such

*Architectural Erosion*, occurs when large and small architectural decisions are intentionally or accidentally violated [1]. In a best case scenario, these violations decrease the maintainability of the system, making it difficult to understand and modify; while in more extreme cases architectural erosion may lead to catastrophic and systemic failure.

In practice, the architecture of a system and its qualities can be maintained using traceability methods that help developers fully understand the impact of design or implementation changes on architecturally significant requirements. Kruchten [2], Borge [3], and others have proposed a proactive approach to preventing design degradation through using design rationales to document architectural decisions. They argue that explicitly recording design decisions, justifications, alternatives, and conflicting perspectives, is necessary in order to preserve architectural qualities. Such approaches utilize traceability links to establish relationships between design decisions, rationales, and architectural views, but do not provide specific guidelines for how the traceability links should be established. Without careful consideration, the resulting traceability links can easily proliferate, creating a situation in which traceability is difficult and costly to maintain, and in which links degenerate into an inaccurate and non-useful state [4].

This situation is illustrated through a series of traceability meta-models that were produced from a study of high-end traceability practices in industry [5]. The Traceability Information Model (TIM) depicted in Figure 1, is derived from these meta-models and shows significant redundancy of traceability paths for establishing relationships between issues, conflicts, alternative options, arguments, rationales, assumptions, requirements, and design decisions. For example decisions can be traced directly to requirements, or can be traced indirectly through either rationales or through issues and conflicts. There is no guidance to inform architects as to the best way to establish traceability, and as a result, practitioners are ill-informed as to how best to accomplish this task. Furthermore, various studies have highlighted the need to simplify the creation and use of traceability as a major process improvement need [6].

The traceability problem is exacerbated when tracing quality constraints related to architecturally significant requirements (ASRs), which describe concerns such as reliability, security, and maintainability. Such ASRs often have a broad reaching impact across the system and are realized through components and behaviors that are visible in a variety of architectural and implementation views at very different abstraction levels.
