

How your environment affects your mental health, body and physical attributes. The environment can facilitate or discourage interactions among people. We have placed a lot of scars to our environment and it's slowly losing its beauty and purpose it is either we use too much or get too much and both of them benefits human being. Though science says earth doesn't need us, we need it. Earth can replenish itself without our help. Human health and well-being are inextricably related to environmental conditions. Clean air and water, fertile land for food production, and energy and material inputs for production are all provided by high-quality natural ecosystems. After school, the ideal place for us to develop, learn, and nurture is at home. A child's mental development, which encompasses cognitive, linguistic, emotional, and physical skills, is stimulated by a peaceful and caring family environment. In such an atmosphere, we may concentrate on strengthening their talents. And that is why we have this thing called Fostering Environment Stewardship. Environmental stewardship conserves natural resources, combats pollution, and safeguards biodiversity, but most significantly, it entails safeguarding and sustaining our environment for future generations. Here in this said activity we need to work together and have discipline. Remember earth doesn't need us to prosper, we need the Earth to live on. Untidy environment makes you want to leave right? That is because untidiness distracts our brain from producing informations, it makes us think more if there are cockroaches under the table beside my feet etc. Mentally and physical, environment affects it and we are going to be unstable when the time comes. In our body clean environment prevents us from diseases, which are common to people who sleeps at dirty places. Fostering Environmental Stewardship helps a lot in our lives it makes our lives comfortable in any imagined ways.

The increase in environmentally induced diseases and the loosening of regulation and safety measures have inspired a massive challenge to established ways of looking at health and the environment Communities with disease clusters women facing a growing breast cancer incidence rate and people of color concerned about the asthma epidemic have become critical of biomedical models that emphasize the role of genetic makeup and individual lifestyle practices Likewise scientists have lost patience with their colleagues and government's failure to adequately address environmental health issues and to safeguard research from corporate manipulation Focusing specifically on breast cancer asthma and Gulf War related health conditions contested illnesses that have generated intense debate in the medical and political communities Phil Brown shows how these concerns have launched an environmental health movement that has revolutionized scientific thinking and policy Before the last three decades of widespread activism regarding toxic exposures people had little opportunity to get information Few sympathetic professionals were available the scientific knowledge base was weak government agencies were largely unprepared laypeople were not considered bearers of useful knowledge and ordinary people lacked their own resources for discovery and action Brown argues that organized social movements are crucial in recognizing and acting to combat environmental diseases His book draws on environmental and medical sociology environmental justice environmental health science and social movement studies to show how citizen science alliances have fought to overturn dominant epidemiological paradigms His probing look at the ways scientific findings are made available to the public and the changing nature of policy offers a new perspective on health and the environment and the relationship among people knowledge power and authority *Environmental Health Sourcebook* Laura Larsen, 2010 Provides updated information about the effects of the environment on human health

Preventing Disease Through Healthy Environments Annette Prüss-Üstün, Jennyfer Wolf, Carlos Corvalán, Robert Bos, World Health Organization, Dr. Maria Neira, 2016 The main message emerging from this new comprehensive global assessment is that premature death and disease can be prevented through healthier environments and to a significant degree Analysing the latest data on the environment disease nexus and the devastating impact of environmental hazards and risks on global health backed up by expert opinion this report covers more than 130 diseases and injuries The analysis shows that 23% of global deaths and 26% of deaths among children under five are due to modifiable

environmental factors and therefore can be prevented Stroke ischaemic heart disease diarrhoea and cancers head the list People in low income countries bear the greatest disease burden with the exception of noncommunicable diseases The report s unequivocal evidence should add impetus to coordinating global efforts to promote healthy environments often through well established cost effective interventions This analysis will inform those who want to better understand the transformational spirit of the Sustainable Development Goals agreed by Heads of State in September 2015 The results of the analysis underscore the pressing importance of stronger intersectoral action to create healthier environments that will contribute to sustainably improving the lives of millions around the world Page 4 of cover
