CHAPTER 5
Modeling Distributions

The distributions we have used so far are called **empirical distributions** because they are based on empirical observations, which are necessarily finite samples.

The alternative is an **analytic distribution**, which is characterized by a CDF that is a mathematical function. Analytic distributions can be used to model empirical distributions. In this context, a **model** is a simplification that leaves out unneeded details. This chapter presents common analytic distributions and uses them to model data from a variety of sources.

The code for this chapter is in `analytic.py`. For information about downloading and working with this code, see "Using the Code" on page xi.

The Exponential Distribution

I'll start with the **exponential distribution** because it is relatively simple. The CDF of the exponential distribution is

$$CDF(x) = 1 - e^{-\lambda x}$$

The parameter, λ, determines the shape of the distribution. Figure 5-1 shows what this CDF looks like with $\lambda = 0.5$, 1, and 2.

In the real world, exponential distributions come up when we look at a series of events and measure the times between events, called **interarrival times**. If the events are equally likely to occur at any time, the distribution of interarrival times tends to look like an exponential distribution.

Selected Works of R.M. Dudley Evarist Giné,Vladimir Koltchinskii,R. Norvaiša,2010-08-13 For almost fifty years Richard M Dudley has been extremely influential in the development of several areas of Probability His work on Gaussian processes led to the understanding of the basic fact that their sample boundedness and continuity should be characterized in terms of proper measures of complexity of their parameter spaces equipped with the intrinsic covariance metric His sufficient condition for sample continuity in terms of metric entropy is widely used and was proved by X Fernique to be necessary for stationary Gaussian processes whereas its more subtle versions majorizing measures were proved by M Talagrand to be necessary in general Together with V N Vapnik and A Y Cervonenkis R M Dudley is a founder of the modern theory of empirical processes in general spaces His work on uniform central limit theorems under bracketing entropy conditions and for Vapnik Cervonenkis classes greatly extends classical results that go back to A N Kolmogorov and M D Donsker and became the starting point of a new line of research continued in the work of Dudley and others that developed empirical processes into one of the major tools in mathematical statistics and statistical learning theory As a consequence of Dudley s early work on weak convergence of probability measures on non separable metric spaces the Skorohod topology on the space of regulated right continuous functions can be replaced in the study of weak convergence of the empirical distribution function by the supremum norm In a further recent step Dudley replaces this norm by the stronger p variation norms which then allows replacing compact differentiability of many statistical functionals by Fr chet differentiability in the delta method Richard M Dudley has also made important contributions to mathematical statistics the theory of weak convergence relativistic Markov processes differentiability of nonlinear operators and several other areas ofmathematics Professor Dudley has been the adviser to thirty PhD s and is a Professor of Mathematics at the Massachusetts Institute of Technology   *Probability in Banach Spaces III* A.
