Dornfeld,2013-03-09 Chemical mechanical planarization or chemical mechanical polishing as it is simultaneously referred to has emerged as one of the critical processes in semiconductor manufacturing and in the production of other related products and devices MEMS for example Since its introduction some 15 years ago CMP as it is commonly called has moved steadily into new and

challenging areas of semiconductor fabrication Demands on it for consistent efficient and cost effective processing have been steady This has continued in the face of steadily decreasing feature sizes impressive increases in wafer size and a continuing array of new materials used in devices today There are a number of excellent existing references and monographs on CMP in circulation and we defer to them for detailed background information They are cited in the text Our focus here is on the important area of process models which have not kept pace with the tremendous expansion of applications of CMP Preston's equation is a valuable start but represents none of the subtleties of the process Specifically we refer to the development of models with sufficient detail to allow the evaluation and tradeoff of process inputs and parameters to assess impact on quality or quantity of production We call that an integrated model and more specifically we include the important role of the mechanical elements of the process The American Catalog ,1896 *Technical Series Bulletin* United States.
