Bodies and Media Ido Yavetz, 2015-08-18 This book presents a recasting of Aristotle's theory of spatial displacement of inanimate objects Aristotle's claim that projectiles are actively carried by the media through which they move such as air or water is well known and has drawn the attention of commentators from ancient to modern times What is lacking however is a systematic investigation of the consequences of his suggestion that the medium always acts as the direct instrument of locomotion be it natural or forced while original movers e.g. stone throwers catapults bowstrings act indirectly by impressing moving force into the medium Filling this gap and guided by discussions in Aristotle's Physics and On the Heavens the present volume shows that Aristotle's active medium enables his theory in which force is proportional to speed to account for a large class of phenomena that Newtonian dynamics in which force is proportional to acceleration accounts for through the concept of inertia By applying Aristotle's medium dynamics to projectile flight and to collisions that involve reversal of motion the book provides detailed examples of the efficacy and coherence that the active medium gives to Aristotle's discussions The book is directed primarily to historians of ancient medieval and early modern science to philosophers of science and to students of Aristotle's natural philosophy

An Automated Real-time Storm Analysis and Storm Tracking Program (WEATRK) Carlton J. Bjerkaas, 1980 The evolution of the WEATRK system is described from the original software obtained under contract in 1977 to the present software configuration The various portions of the software are discussed with emphasis on the algorithms used to determine storm significance and establish the storm track

Results of the two year development effort and operational tests show the usefulness of assimilating large amounts of complex data and generating a computer synthesized product easily used in forecast applications The error analysis performed on the storm track forecast accuracy suggests that few of the errors encountered are due to meteorological effects but they are largely due to parameters such as beam width pulse width antenna rotation rate and rounding errors The non meteorological errors appear to average out over large data sets that is the longer the storm track the smaller the forecast error Although the program now uses a three dimensional analysis very little analysis is performed on the velocity and variance fields The usefulness of these fields along with other improvements are considered
