Linear Programming With Statistical Applications:

Linear Programming with Statistical Applications Vincent Anthony Sposito, 1996
Statistical Applications Vincent A. Sposito, 1989
Statistical Applications of Linear Programming for Feature Selection Via Regularization Methods Yonggang Yao, 2008
Abstract We consider statistical procedures for feature selection defined by a family of regularization problems with convex piecewise linear loss functions and penalties of L_1 or L_∞ nature. For example, quantile regression and support vector machines with L_1 norm penalty fall into the category. Computationally, the regularization problems are linear programming (LP) problems indexed by a single parameter which are known as parametric cost LP or parametric right hand side LP in the optimization theory. Their solution paths can be generated with certain simplex algorithms. This work exploits the connection between the family of regularization methods and the parametric LP theory and lays out a general simplex algorithm and its variant for generating regularized solution paths for the feature selection problems. The significance of such algorithms is that they allow a complete exploration of the model space along the paths and provide a broad view of persistent features in the data. The implications of the general path finding algorithms are outlined for various statistical procedures and they are illustrated with numerical examples.

Optimization Techniques in Statistics Jagdish S. Rustagi, 2014-05-19
Statistics help guide us to optimal decisions under uncertainty. A large variety of statistical problems are essentially solutions to optimization problems. The mathematical techniques of optimization are fundamental to statistical theory and practice. In this book, Jagdish Rustagi provides full spectrum coverage of these methods ranging from classical optimization and Lagrange multipliers to numerical techniques using gradients or direct search to linear, nonlinear, and dynamic programming using the Kuhn-Tucker conditions or the Pontryagin maximal principle. Variational methods and optimization in function spaces are also discussed, as are stochastic optimization in simulation including annealing methods. The text features numerous applications including finding maximum likelihood estimates, Markov decision processes, programming methods used to optimize monitoring of patients in hospitals, derivation of the Neyman-Pearson lemma, the search for optimal designs, simulation of a steel mill, suitable as both a reference and a text. This book will be of interest to advanced undergraduate or beginning graduate students in statistics, operations research, management, and engineering sciences and related fields. Most of the material can be covered in one semester by students with a basic background in probability and statistics. Covers optimization from traditional methods to recent developments such as Karmarkar's algorithm and simulated annealing. Develops a wide range of statistical techniques in the unified context of optimization. Discusses applications such as optimizing monitoring of patients and simulating steel mill operations. Treats numerical methods and applications. Includes exercises and references for each chapter. Covers topics such as linear, nonlinear, and dynamic programming, variational methods, and stochastic optimization.
