**Linear Systems Theory** Ben M. Chen, Zongli Lin, Yacov Shamash, 2004-08-27 Includes MATLAB based computational and design algorithms utilizing the Linear Systems Toolkit All results and case studies presented in both the continuous and discrete time settings

Linear Systems Theory Ben M. Chen, Zongli Lin, Yacov Shamash, 2012-12-06 Structural properties play an important role in our understanding of linear systems in the state space representation The structural canonical form representation of linear systems not only reveals the structural properties but also facilitates the design of feedback laws that meet various control objectives In particular it decomposes the system into various subsystems These subsystems along with the interconnections that exist among them clearly show the structural properties of the system The simplicity of the subsystems and their explicit interconnections with each other lead us to a deeper insight into how feedback control would take effect on the system and thus to the explicit construction of feedback laws that meet our design specifications The discovery of structural canonical forms and their applications in feedback design for various performance specifications has been an active area of research for a long time The effectiveness of the structural decomposition approach has also been extensively explored in nonlinear systems and control theory in the recent past The aim of this book is to systematically present various canonical representations of the linear system that explicitly reveal different structural properties of the system and to report on some recent developments on its utilization in system analysis and design

Synchronization of Multi-Agent Systems in the Presence of Disturbances and Delays Ali Saberi, Anton A. Stoorvogel, Meirong Zhang, Peddapullaiah Sannuti, 2022-01-18 This monograph explores the synchronization of large scale multi agent dynamical systems in the presence of disturbances delays and time varying networks Drawing upon their extensive work in this area the authors provide a thorough treatment of agents with higher order dynamics different classes of models for agents and the underlying networks representing the agents actions The high technical level of their presentation and their rigorous mathematical approach make this a timely and valuable resource that will fill a gap in the existing literature Divided into two sections the first part of the book focuses on state synchronization of homogeneous multi agent systems The authors consider state synchronization by determining control strategies for both continuous and discrete time systems that achieve state synchronization under both full and partial state coupling The chapters that follow examine multi agent systems with both linear and nonlinear time varying agents input delays for continuous and discrete time systems and communication delays for continuous time systems The second part of the book is dedicated to regulated output synchronization of heterogeneous multi agent systems with linear and nonlinear agents Both sections of the book include performance considerations in  $H_2$  and  $H_\infty$  norms in the presence of external disturbances Research on synchronization of multi agent systems has been growing in popularity and is highly interdisciplinary with applications to automobile systems aerospace systems multiple satellite GPS and high resolution satellite imagery aircraft formations highway traffic platooning industrial process control

with multiple processes and more Synchronization of Multi Agent Systems in the Presence of Disturbances and Delays will therefore be of interest to upper level graduate students researchers and engineers in industry working on interconnected dynamical systems

**Stock Market Modeling and Forecasting** Xiaolian Zheng,Ben M. Chen,2013-04-05 Stock Market Modeling and Forecasting translates experience in system adaptation gained in an engineering context to the modeling of financial markets with a view to improving the capture and understanding of market dynamics The modeling process is considered as identifying a dynamic system in which a real stock market is treated as an unknown plant and the identification model proposed is tuned by feedback of the matching error Like a physical system a financial market exhibits fast and slow dynamics corresponding to external such as company value and profitability and internal forces such as investor sentiment

and commodity prices respectively The framework presented here consisting of an internal model and an adaptive filter is successful at considering both fast and slow market dynamics A double selection method is efficacious in identifying input factors influential in market movements revealing them to be both frequency and market dependent The authors present work on both developed and developing markets in the shape of the US Hong Kong Chinese and Singaporean stock markets Results from all these sources demonstrate the efficiency of the model framework in identifying significant influences and the quality of its predictive ability promising results are also obtained by applying the model framework to the forecasting of major market turning periods Having shown that system theoretic ideas can form the core of a novel and effective basis for stock market analysis the book is completed by an indication of possible and likely future expansions of the research in this area Proceedings of International Conference on Systems Science and Engineering (ICSSE '88) : 25-28 July 1988, Beijing, China
