Wolfgang Herzner, Frank Kappe, 2012-12-06 Over the last few years, multimedia hardware and applications have become widely available in the personal computer and workstation environments, and multimedia is rapidly becoming an integral part of stand-alone single user systems. In contrast, the problems encountered when moving to open distributed environments are only just beginning to be identified. Examples are the transmission of dynamic data, video, sound over large distances, and cooperative work. Following on from two successful workshops on multimedia, EG MM 94 concentrates on topics related to multimedia, hypermedia in open distributed environments. The goal of this symposium was not only to give a comprehensive overview of the current state of research, development, and standardisation in the field, but also to provide an opportunity for live demonstrations to experience directly the presented results. The symposium program consists of two invited keynote speeches, eight technical sessions, one tutorial, and one demonstration session. A workshop following immediately after the symposium provides an opportunity for in-depth discussions of open problems among experts. It is intended to fill a gap often experienced at larger meetings and conferences: the lack of time to discuss in detail issues raised during the event, such as the characteristics of different approaches to a certain problem. It is intended that the results of the workshop be published as a Eurographics Technical Report. **Advances in Network Management**

Jianguo Ding, 2016-04-19 Over the past two decades, business volume of hardware and software in the U.S. has decreased by about seventy percent, while the cost of management and support has grown from 20 billion to 140 billion. With close to seventy percent of this growing figure being spent on the management of legacy systems and only thirty percent on new systems, improvement is needed.

People and Computers XX - Engage Nick Bryan-Kinns, Ann Blandford, Paul Curzon, Laurence Nigay, 2007-08-10 Reading has arguably the longest and richest history of any domain for scientifically considering the impact of technology on the user. From the 1920s to the 1950s, Miles Tinker (1963) and other researchers ran hundreds of user tests that examined the effects of different fonts and text layout variables, such as the amount of vertical space between each line of text, called leading. Their research focused on user performance, and reading speed was the favoured measure. They charted the effect of the manipulated variables on reading speed, looking for the point at which their participants could read the fastest. Their assumption was that faster reading speeds created a more optimal experience. Printers and publishers eagerly consumed this

research In recent years some of these variables have been reexamined as the technology and capabilities evolve with the advent of computers and computer screens Dillon 1992 examined how to design textual information for an electronic environment Boyarski et al 1998 examined the effect of fonts that were designed for computer screens Dyson Kipping 1998 examined the effect of line length on computer screens Larson et al 2000 examined the effect of 3 D rotation on reading Gugerty et al 2004 demonstrated a reading performance advantage with the Microsoft ClearType display technology
